Charlie,

The VFO-230 schematic, high resolution by the way, is included in the TS-830S high resolution service manual, page 57. You can download the service manual at the following link.

http://www.n6wk.com/kenwood/TS-830S-Service-High%20Resolution.pdf

Gordon's website is at the following link:

http://www.n6wk.com/kenwood/

23094. CALIBRATING AN EXTERNAL KENWOOD TS-520S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-26 20:16:50 UTC
From: OvaEasy
Topic: 23094 Message: 23094

I RECENTLY RECEIVED A VERY NICE KENWOOD TS-520S EXTERNAL FROM A GROUP MEMBER.
THERE IS A MAJOR ERROR IN THE MAIN WHITE DIAL IT IS OFF ABOUT 12kHz USING THE 25kHz 520 MARKER.
REMOVING THE TOP COVER AND TAKING A PEAK DOES NOT SEEM TO EASILY HAVE A MEANS OF LOOSENING A SCREW OR 2 TO FACILITATE MOVING THE DIAL A SMALL AMOUNT SO AS TO CORRESPOND TO THE MARKER.
ANY IDEAS OR SUGGESTIONS GREATLY APPRECIATED OR I WILL HAVE TO SEND THE VFO BACK. ALTHOUGH I WOULD RATHER KEEP IT AS AN IMPORTANT ADDITION TO MY VINTAGE STATION.
THANK YOU IN ADVANCE FOR YOUR CONSIDERATION AND REPLY
BARRY. WB6LDL

SORRY FOR THE CAPS LOCK BUT JUST GOT HOME FROM THE EYE DOC AND I AM DILATED.

Hi Barry,

You can remove the VFO dial and get access to the screw that holds
the white disk in place.

Hi Dan. I am not sure about the TS-520, bu on my TS-530S I do not have to remove the front face of the radio to replace the lamps and lube the VFO gears. The VFO comes out as a unit once disconnected, by removing the 4 Allen screws at its 4 corners. The meter lamo is easy to replace by simply removing the top cover.

I had a TS-520 years ago, but neber had to remove the VFO. I did replace the meter lamp, and it is similar in that respect to the TS-530S.

23101. My Hybrid radio experiences.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-26 08:31:48 UTC
From: allan_gm1sxx
Topic: 23101 Message: 23101

Hi Group.

My name is Allan and this is my first posting to the group.
I recently bought a rather nice TS-820S at a rally for not a lot of money. It passed the all-important 'sniff test', so I parted with my cash. I love these old hybrid radios and the most common reason I've found for low output power is a weak driver (12BY7A) bottle. So long as the radio hasn't been abused, and you can usually tell from the 'sniff test' and the state of the cabinet screws, the PA's are generally fine.
This one was giving rather less power than I had hoped for but replacing the driver with a known good one instantly restored the PA to full output. Driver failure is fairly common in these radios, I suspect caused mainly by the valves being over-voltaged deliberately.

Typically both Yaesu and Trio/Kenwood place over 300V on the anodes of a valve designed for 200-250. It shouldn't come as a surprise that thay fail quite frequently. The PA's in this radio were the Matsushita S2001A orginals and still work perfectly. I like this 820S. It's a classy radio. I bought it as an Autumn project, so I'm just a bit disappointed that it works so well :-)

The 12BY7A was designed for TV service, as a video amplifier. Here's something strange I've noticed about them. Every one I've tried, and thats been a few dozen good NOS and ex-equipment tested ones, has exhibited a faint internal glow on TX. Not like the harsh glow of a 'soft' valve, which is often external to the anode structure, but in the inter-electrode gap between cathode and anode. Am internal blue glow is often present in 'soft' valves, but all of these tested good on a valve tester and work perfectly in a radio. The glow is very pale blue in colour and only visible in a darkened room, not like the deep blue of violet glow you get with a soft tube.

I suspect this is the result of feeding them excessive anode voltage.
nearer 350 rather than the specified 250 (maximum).... probably does them no good at all.

http://www.r-type.org/exhib/aaa0086.htm

I've had quite a few hybrid radios through my hands for repair and only one had bad PA bottles (killed by gross abuse.. melted envelopes). All of the others had good PA's but most had sick 12BY7A drivers. So next time your power output is low, swap out the driver and see how it goes.
It's a cheaper option than replacing the PA's only to find they are not faulty after all.

My other hybrids are FT102 FT200 and FL101/FR101, so this is my first Kenwood radio, and I rather like it.

Hi Al. Having at one time owned a Kenwood TS-520, and a Yaesu FT-101EE, and run them side by side with the same antenna, I have to say that the TS-520 was definitely superior. It had a better receiver, and got better TX audio reports. I have also owned a Yaesu FT-902DM, but I didn't have any Kenwood radios to compare it to at the time. The FT902DM was a nice radio, but I like the Kenwood TS-530S, TS-430S and TS-130SE that I have now. I have never been much of a Yaesu fan, and I doubt that I ever will be.

Hi Richard,

No skinned knuckles!

I've just changed the meter lamp on my ts-830 and it couldn't be easier to get to. Take off the top cover and unplug the speaker lead so you can set it aside. The meter lamp sits in a clear rubber grommet at the top of the meter. The lampholder was broken beyond repair on mine so I got a 12 volt minature wire terminated lamp and soldered it in. It fits perfectly in the grommet. I don't have a make or part number. The guy in the shop gave me two loose out of a drawer and didn't even charge for them.

Chris

23105. Re: TS-820S display intermittently goes to "9.001"

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-27 14:06:07 UTC
From: w5rkl
Topic: 23100 Message: 23105

Hello Bill,

When the digital display shows "9.001", I'm going to assume the 820 continues to operate properly, both in transmit and receive.

If this is the case with your 820, more than likely the problem is the digital display unit's internal fixed connecting pin and the sockets on each board they are inserted into have become dirty/corroded over time.

The digital display has 2 PC boards inside the metal enclosure, "COUNTER" (X54-1160-00) and "COUNTER MIX" (X54-1150-00). These boards interconnect to each other through a set of "fixed pins" inside the digital display metal enclosure. These pins become dirt/corroded over time resulting in strange behavior of the digital display. In most cases, cleaning the outer pins/plugs, one on top and one on the bottom, will not fix this problem. To fix the problem, providing there are no other problems with the digital display unit or other circuits, I recommend performing the following:

The digital display unit is located to the left of the VFO, between the VFO and the IF UNIT board (820 right side up and front panel facing you). The IF UNIT board is the vertical board with the components facing the left side of the 820.

Turn power off to the 820, remove all cables including the power cable, then remove the top and bottom covers.

The digital display has 2 multi-wire plugs, one on the bottom and one on the top. Remove both plugs.

Loosen the digital display mounting screws and gently remove the digital display unit.

Remove the metal cover, exposing both PC boards.

You will note that each PC board has mounting screws.

Remove one board at a time by removing the PC board mounting screws.

Use contact cleaner and an old tooth brush to clean the fixed pins. Give the PC board pin sockets a shot of contact cleaner then insert and remove the PC board a few times. This allows "scrubbing" action to take place between the pins and the sockets, cleaning the sockets of dirt/corrosion.

Use the tooth brush and give a light scrubbing on the edges where the mounting screws are inserted. This area is the ground for the PC board.

Insert the PC board for the final time and secure the board with the mounting screws. Do NOT use excessive force when tightening the screw as it is quite possible you could strip the threads of the screw(s).

Repeat the same cleaning procedure to the other PC board.

Once completed and both boards are secured to the metal enclosure, use canned air, available from Walmart, to remove any excess contact cleaner then reinstall the outer cover.

Install the digital display unit back into the 820 and secure it with the mounting screws.

Give the top and bottom contacts a shot of contact cleaning then reconnect the 2 plugs, one on the bottom and one on the top, a couple of time. Remove the plugs and use canned air to remove excess contact cleaner then reinsert both plugs onto the digital display unit for the final time.

Check for pinched wires, shorts and/or broken or pulled plugs that may have been caused by handling the 820 with the covers off. Ensure the SEND switch is in the down position (REC). If everything looks good then reconnect the power cable and turn the 820 on. The digital display should display the proper operating frequency and display a smooth change in frequency as you rotate the VFO knob. If everything is working properly, remove power and reinstall the top and bottom covers, reconnect all cables, and enjoy your 820.

Always observe proper safety precautions at ALL TIMES when troubleshooting and repairing any piece of electronic equipment.

Never work on electronic equipment when you are tired, sleepy, or don't feel good.

When working with contact cleaner, always read and adhere to the warnings/cautions on the side of the container. Contact cleaner is flammable and it only takes a small spark to ignite it.

Never use excessive amounts of contact cleaner (soaking switch wafers, control pots, etc), a small amount goes a long way.

Use canned air to remove any and all excess contact cleaner.

I have seen tubes such as this with a faint blue glow clinging to the glass envelope. Is this what you are referring to ? I have had tubes do this, and work well for years! I wouldn't be concerned about it as long as the tube continues to work for you!

I can remember my Grandmother's old console radio (Stromberg-Carlson) that had a 5U4 rectifier (I believe it was) that glowed an orange color for the first few moments that the set was turned on. Then when the filaments heated up and the tube started conducting, everything cleared up, and returned to normal. That set was old when I was first aware of it, and continued to operate for many years after.

"Hollow State", ya gotta LOVE it !

23110. TS830S won't tune -- so need help ?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-27 17:50:04 UTC
From: jwarnerr
Topic: 23110 Message: 23110

Last ran the TS830 in '99 and it ran fine (dxing).
Just pulled the rig out of the closet and cant get any
tuning function to work (no meter response on DRV, PLATE,
and LOAD). This is a surprise! I do have 60ma bias and it
adjusted properly.

I have tried replacing the drive tube several times and still
no response. All front and back switches are correctly set
(I think) as per the Manual.

I have no way to test the drives tubes - but have a whole box
of them and some marked NEW. Its hard to believe all of these
tubes are bad - I would still get some meter reading. I get
no Drive deflection at all.

I get no meter response whatever for any tuning function
beyond the 60ma bias test.

Any ideas?

Electrolytic capacitors generally fail after a long period of storage. I'm guessing that you don't have high voltage. What does the meter say?

Subject: [TS-520_820_530_830] TS830S won't tune -- so need help ?

Last ran the TS830 in '99 and it ran fine (dxing).
Just pulled the rig out of the closet and cant get any
tuning function to work (no meter response on DRV, PLATE,
and LOAD). This is a surprise! I do have 60ma bias and it
adjusted properly.

I have tried replacing the drive tube several times and still
no response. All front and back switches are correctly set
(I think) as per the Manual.

I have no way to test the drives tubes - but have a whole box
of them and some marked NEW. Its hard to believe all of these
tubes are bad - I would still get some meter reading. I get
no Drive deflection at all.

I get no meter response whatever for any tuning function
beyond the 60ma bias test.

Any ideas?

TNX & 73.

Based on the information provided, it appears the HV, LV, filament, and bias supplies are working.

The post stated the IP meter indicates 60ma of final tube idling current. That tells me the HV supply is working.

I suspect dirty wafer switches on the FUNCTION, MODE, and BAND switch. Clean each switch wafer, one at a time. This includes the final cage switch wafer, don't forget that one.

Clean the MIC and CAR control pots.

Pull each PC board plug, give the pins and plugs a shot of cleaner, then insert and remove each plug a couple of times. Do this will each plug.

Check each PC board mounting screw. Loosen the screws one full turn then tighten. Do this to the chassis grounds as well.

Use canned air to remove any/all excess contact cleaner.

Once all these steps have been done, tune the 830 up into a dummy load.

I seriously doubt the HV filter capacitors are the source of this problem. The HV supply is working otherwise there would be no "no-signal" 60ma idling current indication on the IP meter in transmit. The "IP" meter indication is the final tube's "Plate current". It takes a voltage applied to the final tube's plate in order for electrons to flow through the tubes to create a current, hence 60ma IP idling current on the meter in transmit.

Maybe I mispoke and didnt understand your question.

There is a HV position on the meter switch I did not try. I
dont know how to use this feature. But, with the Mode on Tune
and the Meter on HV, if I flip to Send I do get full swing on
the meter to the 300ma mark.

What does this mean?

Hi Dick. As stated before, I get NO meter deflection at all
in any tune function. None. No meter deflection period.
Dead as a doornail.

The only problem in the history of this radio was a lose
(cold soldered) wire to the center of the female PL259?
RF antenna socket on the back of the radio. My audio and RF
had always been poor, then I noticed the socket moving if I
jiggled the antenna connector on the back of the radio. When
I took the sides off and inspected the socket from the inside
the center wire was lose, so I resoldered it.. everyhing
worked normally after that.

Maybe I will have to send this radio off to someone because
there isnt anyone around here (that I know of) who works on
radios.

Jerry

Jerry , I don't know where you are located , but usually that doesn't matter too much .

I wouldn't give up just yet . The guys on this group know these radios so intimately , both inside and out , that they can usually "talk" you through the problem , right down to the exact component(s).

Their knowledge absolutely amazes me .

Thanks Charlie - I wont give up just yet. Its a vy fn radio
worth salvaging if I can, just bothers me I didnt keep it
active. Whats worse I had a brand new seldom used 830S I sold
last year that did work, and now here I sit partly because of
confidence in the 830. I will stand by for any further comments
tonight but I may be sending it to Burqhart or Kenwood, if
they still work on radios? Thanks!

The HV position is to measure the high voltage on the finals. There should be a meter scale marked 0-1000 volts or so, marked "HV". When you go to transmit in SSB mode it should read around 850V, in CW under load it would dip to around 750V but since you see no plate current I wouldn't expect any loading on the HV supply to make it sag.

So, the question is, do you have High Voltage as read on the front panel meter in transmit with the meter switch in the HV position?

Jerry,

The HV meter scale is "RED". Each number is a multiplied by "100". That means, 1 is "100", 2 is "200" etc.

Your said:

"... with the Mode on Tune and the Meter on HV, if I flip to Send I
do get full swing on the meter to the 300ma mark."

Repeat that step again, with the meter set to HV and note where the meter rest on the "RED" scale. Multiply the reading by 100 and you have the HV applied to the final amplifier. The small tick marks between the numbers on the RED scale represent "50 VDC". That means if the needle rest on the small tick mark between 8 and 9, the HV is "850VDC".

It is obvious there is HV present on the final tubes otherwise the meter would not be as high as it is.

I would not swap out any tubes, make any adjustments inside the radio, replace any capacitors, resistors, etc, until you clean the radio first. In most cases, dirt and corrosion is the cause of problems with radio that have sat for long periods of time.

Another issue you may be confronted with is arcing in the final tubes. Arcing occurs in power tubes such as the 6146 after they have sat for a very long time, 10 years in your case. Air leaks past the pins resulting in a build up of air (gas) within the tube glass envelope. When the tube conducts, the gas results in a positive ion explosion, arcing, to occur in the tube. There is no way to remove or eliminate the excessive gas in the tube. The only fix is to replace the tube. The arcing may not occur right away.

I have seen this quite often with final tubes that sit idle for long periods of time. I recently experienced this with a Heathkit HW-101 that sat for "20 years". The 6146 final tubes produce 100 watts output but, after about a week, the final tubes arced. The arcing occurred with only no signal idling current, 50 ma in the case of the HW-101, flowing in the tube. Replaced the tubes eliminated the problem.

I am not saying your lack of RF output is due to a gassy and/or faulty set of final tubes. At this point I do not believe that is the problem in your case. I am only warning you of the possibility of the final tubes arcing at a later time due to the tubes sitting for 10 years.

Hmmm,

I am not sure if running the 6146 tetrodes for 8-10 hours to have some significant getter action clean up the gasses inside would be useful, but it wouldn't hurt before trying to drive them if they have been idle for 10 years.

Just a thought, if they weren't bad when they were put away they may be OK.

Greg

The small tick marks between the numbers on the RED scale represent "50 VDC". That means if the needle rest on the small tick mark between 8 and 9, the HV is "850VDC".

It is obvious there is HV present on the final tubes otherwise the meter would not be as high as it is.

I would not swap out any tubes, make any adjustments inside the radio, replace any capacitors, resistors, etc, until you clean the radio first. In most cases, dirt and corrosion is the cause of problems with radio that have sat for long periods of time.

Another issue you may be confronted with is arcing in the final tubes. Arcing occurs in power tubes such as the 6146 after they have sat for a very long time, 10 years in your case. Air leaks past the pins resulting in a build up of air (gas) within the tube glass envelope. When the tube conducts, the gas results in a positive ion explosion, arcing, to occur in the tube. There is no way to remove or eliminate the excessive gas in the tube. The only fix is to replace the tube. The arcing may not occur right away.

I have seen this quite often with final tubes that sit idle for long periods of time. I recently experienced this with a Heathkit HW-101 that sat for "20 years". The 6146 final

tubes produce 100 watts output but, after about a week, the final tubes arced. The arcing occurred with only no signal idling current, 50 ma in the case of the HW-101, flowing in the tube. Replaced the tubes eliminated the problem.

I am not saying your lack of RF output is due to a gassy and/or faulty set of final tubes. At this point I do not believe that is the problem in your case. I am only warning you of the possibility of the final tubes arcing at a later time due to the tubes sitting for 10 years.

Yeah, I finally saw his initial post. I would agree with your line of thinking, either dirty switches or the infamous Kenwood board connectors may be intermittent after 10 years on the shelf.
BTW, this may be why I have never seen such flakey-ness in TS520 units. They used wire wraps which someone was asking about here last week.... When Kenwood went to those nice little plastic plugs in the mid-eighties their radios became notorious for plugs that have to be removed/cleaned and reseated. Still, plugs make it easier to remove a board for repair no question.

Greg,

Jerry said there was 60ma of idling current in his initial post.

> I seriously doubt the HV filter capacitors are the source of this problem. The HV supply is working otherwise there would be no "no-signal" 60ma idling current indication on the IP meter in transmit. The "IP" meter indication is the final tube's "Plate current". It takes a voltage applied to the final tube's plate in order for electrons to flow through the tubes to create a current, hence 60ma IP idling current on the meter in transmit.

23123. Tuning the TS-520

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-28 00:42:36 UTC
From: h.clagett
Topic: 23123 Message: 23123

This is probably a stupid question form a beginner. I bought my TS-520 two years ago and I am about ready to put it on the air. My only experience thus far has been with solid state: ie, no final drive to tune. I plan on running it on a Butternut vertical thru an MJF "Tuner."
Do I tune the finals into a 50 ohm load and then tune the "Tuner" to the antenna? or simply connect the rig to the antenna and tune the finals w/o the "Tuner."

Thanks for any help you can provide.

Hal Clagett

hi everyone im needing the following ok,

for a ts830s

VBT knob 3 k23-0740-04
VBT tone pot vr1 / r24-3402-05
IF shift-notch pot vr2 /r24-9401-05
MIC CAR pot vr9 / r24-3401-05
a pair of 6146B tubes and 2 12BY7A tubes ., and maybe a pair 6HF5 tubes and a 6GK6

if any one has the following or knows were i can get all of this at please contact me vi my email at my callsign as follows kg6nxx@...
my name is jon im in california thank you all very much and i,ll be standing by for all replys 73s for now .

kg6nxx jon.

Jerry , I recently obtained a TS-830S , that had set for a number of years . I followed their advice of a THOROUGH cleaning of all of the pots , switches etc. , with DeoxIT D5 . I took a long time on especially the bandswitch and I did almost miss the part in the final cage , because I hadn't got that far along to open it up , so don't forget it . Take a LOT of time cleaning the bandswitch .

When I brought the rig up on the Variac , everything on receive is smooth as silk . Well worth the investment in time .

I am listening to the receiver right now . I have not yet been able to try the transmitter , because I am waiting to order new finals , that this particular radio DOES need .

However following their step by step advice (THANKS GREG) , as I have already , I do not anticipate ANY problems with the transmitter .

You won't find anyone any better anywhere , than the guys on this group to get you up and running .

I am going through the cleaning process right now on the remote VFO-230 . However it was known to have "issues" , when I traded for the rig . But I have NO doubt , if I can't locate the problem , that this group WILL put me on the right track .

Best of Luck and I hope to work you soon , when we both get our rigs on the air !!

Charlie , W5COV

Hi Hal. You need to tune the the finals into a 50 Ohm dummy load first. Then you can adjust the tuner if necessary. Hopefully you set up the antenna so that most of the time you don't need the tuner. When you do, make note of the frequency, and the tuner settings. Make a chart of these frequencies and settings. This will help you set thing up quickly, and with minimum on-the-air test transmissions.

I have a Butternut HF6V antenna and it certainly does NOT need a tuner unless you plan on operating 75/80 m from one end to the other !
 If you have it installed properly with radials and all, any band I have set it up (Initial adjustment) for has quite low SWR./
If you want to tune up on a dummy load for the initial adjustments for a particular freq, that can prevent some QRM on the air. This is great !
 Switching to the actual antenna, just will require a quick touch-up tweak on the loading and plate tuning.
The tube final and Pi network can do fine with a wide range of Z and X from oddball antennas. Save the tuner for your SolidState rigs..

Cleaned all connections as per Mike and same as before. Hv
60ma about 900-950v HV ... no output or meter response on tuning.

Topic: 23110 Message: 23129

Did it all and same as before. Have 60ma bias and 900v HV.
No tuneup drive, carrier, plate, or load response. Im stumped.
Jerry

> I seriously doubt the HV filter capacitors are the source of this problem. The HV supply is working otherwise there would be no "no-signal" 60ma idling current indication on the IP meter in transmit. The "IP" meter indication is the final tube's "Plate current". It takes a voltage applied to the final tube's plate in order for electrons to flow through the tubes to create a current, hence 60ma IP idling current on the meter in transmit.

Mike,

Thank you for an interesting read. Found it quite revealing to read about a 3% filament voltage change can result in a 50% decrease of tube life. I am thinking about putting in a regulated heater supply. (easy enough to do)

You should be reading the Volts scale in the HV metering position, on the 520 meter the 300 MA on the IP scale lines up with about 875 volts, a good indication with no load (no current on the iP scale)....When I am loded up for 100 W out on CW, my HV is close to 825 Volts and iP is 200 ma.

Maybe I mispoke and didnt understand your question.

There is a HV position on the meter switch I did not try. I
dont know how to use this feature. But, with the Mode on Tune
and the Meter on HV, if I flip to Send I do get full swing on
the meter to the 300ma mark.

What does this mean?

Jerry

The Blue glow on the inside surfce of the glass is "envelope fluorescense" and not the same as the harmful 'gassy tube' purple blue glow that shows up inside the plate's enclosed area.
The envelope glow is from the stream of a few of the accelerated electrons that blow right through the plate and hit the glass.
An erie effect but harmless.

I have seen tubes such as this with a faint blue glow clinging to the glass envelope. Is this what you are referring to ? I have had tubes do this, and work well for years! I wouldn't be concerned about it as long as the tube continues to work for you!

I can remember my Grandmother' s old console radio (Stromberg-Carlson) that had a 5U4 rectifier (I believe it was) that glowed an orange color for the first few moments that the set was turned on. Then when the filaments heated up and the tube started conducting, everything cleared up, and returned to normal. That set was old when I was first aware of it, and continued to operate for many years after.

"Hollow State", ya gotta LOVE it !

Subject: [TS-520_820_ 530_830] My Hybrid radio experiences.

Hi Group.

My name is Allan and this is my first posting to the group.
I recently bought a rather nice TS-820S at a rally for not a lot of money. It passed the all-important 'sniff test', so I parted with my cash. I love these old hybrid radios and the most common reason I've found for low output power is a weak driver (12BY7A) bottle. So long as the radio hasn't been abused, and you can usually tell from the 'sniff test' and the state of the cabinet screws, the PA's are generally fine.
This one was giving rather less power than I had hoped for but replacing the driver with a known good one instantly restored the PA to full output. Driver failure is fairly common in these radios, I suspect caused mainly by the valves being over-voltaged deliberately.

Typically both Yaesu and Trio/Kenwood place over 300V on the anodes of a valve designed for 200-250. It shouldn't come as a surprise that thay fail quite frequently. The PA's in this radio were the Matsushita S2001A orginals and still work perfectly. I like this 820S. It's a classy radio. I bought it as an Autumn project, so I'm just a bit disappointed that it works so well :-)

The 12BY7A was designed for TV service, as a video amplifier. Here's something strange I've noticed about them. Every one I've tried, and thats been a few dozen good NOS and ex-equipment tested ones, has exhibited a faint internal glow on TX. Not like the harsh glow of a 'soft' valve, which is often external to the anode structure, but in the inter-electrode gap between cathode and anode. Am internal blue glow is often present in 'soft' valves, but all of these tested good on a valve tester and work perfectly in a radio. The glow is very pale blue in colour and only visible in a darkened room, not like the deep blue of violet glow you get with a soft tube.

I suspect this is the result of feeding them excessive anode voltage.
nearer 350 rather than the specified 250 (maximum)... . probably does them no good at all.

http://www.r- type.org/ exhib/aaa0086. htm

I've had quite a few hybrid radios through my hands for repair and only one had bad PA bottles (killed by gross abuse.. melted envelopes). All of the others had good PA's but most had sick 12BY7A drivers. So next time your power output is low, swap out the driver and see how it goes.
It's a cheaper option than replacing the PA's only to find they are not faulty after all.

My other hybrids are FT102 FT200 and FL101/FR101, so this is my first Kenwood radio, and I rather like it.

Recive and all other functions are normal. Calbiration works.
The radio is very sound mechnically, all shafts etc. Everything
inside the cage is normal. 6146s even look normal. This radio
has had excellent care+ as with all my gear. I guess I find a
radio repair man tomorrow. I shouldnt complain especially after
all the many years of problem free service the radio has given
but I am totally perplexed.
Tnx 73. Jerry

23136. Kenwood DG-5

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-28 07:20:17 UTC
From: jsloss
Topic: 23136 Message: 23136

My DG-5 is behaving badly! It operates correctly in all respects but occasionally the tens digit will decrease 2 numerals. ie 3523.3 becomes 3503.3, 7236.5 becomes 7216.5. This 20 Kc drop occurs with both even and odd number tens digits with all bands being affected. The "drop down" only lasts for a split second or so. This 20 Kc shift occurs from a cold start of the TS-520 and the counter.

The problem is in this DG-5 as my other DG-5 has no operating problems when used with the same rig. I randomly selected the above frequencies as an example and could have used any band and any frequency with an even or odd number tens digit for my example.

I suspect this is an electrical problem rather than a cold solder joint or broken trace. Would appreciate thoughts as to the specific area to start troubleshooting.

Thank you

Joe k7mks

Hi group.

My posting re the faint blue glow 'inside' the anode structure seems to have spawned a few replies. I've seen typical'gassy' valves with their 'harsh', often dark blue, fluorescence.. but what I'm describing is completely different.

Every 12BY7A I've looked at to date has glowed internally (inside the anode structure) when viewed in a darkened room. The glow is faint and is pale blue in colour and of course only present when the radio is keyed. In fact I use this fluorescence to determine if the driver stage is getting HT, without having to bother measuring it.

All of these valves test good in a valve tester and all provide full output, so I'm wondering if the elevated anode voltage is a factor? The 12BY7A was designed for 200-250 on the anode, but in Yaesu and Kenwood radios, is typically fed over 300V. My FT-102 delivers 350V to the anode... ouch! I haven't measured the voltage on my TS-820S... yet.

If anything, it does demonstrate that a blue glow in the inter-electrode space doesn't guarantee that you have a dud.

Although the 12BY7A driver seems to have a short life in Yaesu and Kenwood hybrid radios, this is rarely ever the case when they are run under the specified operating conditions. Perhaps they are operated on an elevated voltage because it simplified the PSU design, or maybe it provides a bit of extra drive. I'm not sure.

Joe,
I don't have a solution to your specific problem, but I was able to improve the stability of my DG-5 (and remove "hash" in the TS-520S), by applying a couple of the Kenwood suggested "fixes" on Mods.dk under Kenwood DG-5. I installed the voltage regulator by-pass capacitor, and also found one shorted trace.

The RCA tubes are rated at 330 V so Kenwood is not exceeding the ratings.

On another note: these tubes are sensitive to filament heating voltages unlike the 6146B which can withstand a wide range of filament voltages.

Run these rigs of a regulated 13 V power supply and adjust the voltage that the filament exactly is 12.6 V while transmitting. You will not be sorry! See the recent link to the Eimac documents on tube life.

in these radios, I suspect caused mainly by the valves being over-voltaged deliberately.
>
> Typically both Yaesu and Trio/Kenwood place over 300V on the anodes of a valve designed for 200-250. It shouldn't come as a surprise that thay fail quite frequently. The PA's in this radio were the Matsushita S2001A orginals and still work perfectly. I like this 820S. It's a classy radio. I bought it as an Autumn project, so I'm just a bit disappointed that it works so well :-)
>
> The 12BY7A was designed for TV service, as a video amplifier. Here's something strange I've noticed about them. Every one I've tried, and thats been a few dozen good NOS and ex-equipment tested ones, has exhibited a faint internal glow on TX. Not like the harsh glow of a 'soft' valve, which is often external to the anode structure, but in the inter-electrode gap between cathode and anode. Am internal blue glow is often present in 'soft' valves, but all of these tested good on a valve tester and work perfectly in a radio. The glow is very pale blue in colour and only visible in a darkened room, not like the deep blue of violet glow you get with a soft tube.
>
> I suspect this is the result of feeding them excessive anode voltage.

Jerry, Do you have another receiver to listen to your transmit frequency and see if any signal is produced before the PA or before the driver ??? Maybe you can check the RF driving the 12BY7 and what goes out of it ?? I think there is a service manual available. The user's manual schematic will help too. Don't give up, it's easier to find a dead issue than an intermittent one. Good luck & 73's - Daniel, ON5PY

23148. TS-530S ALC Problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-29 06:59:30 UTC
From: ah6rr1
Topic: 23148 Message: 23148

I have a 530 that has a problem with the ALC the meter wil jump around all over the place. I have replaced the driver tube with a new one and it was working fine. then all of a sudden no ALC control at all. I do notice when I move the 300A wire the meter will peg even with the Car control turned all the way down. Also I can not get the IP to change from 85-90mils in any mode. Does anyone have any suggestions?
Thanks
Roland AH6RR

Hello Roland,

ALC is not produced in the driver tube or the RF UNIT. ALC is produced on the AF UNIT and only when the final tube grids are driven positive.

What "300A" connection are you talking about, IF UNIT 300A or the RF UNIT 300A? I suspect you meant plug 7 pin 4 on the RF UNIT.

Plug 7 pin 4 (300A) provides the driver tube plate voltage. If plug 7 is intermittent then the driver tube's plate voltage will also be intermittent resulting in intermittent RF output in transmit and, if the driver tube signal level is high enough to push the final tube grids positive, there will be intermittent ALC as well. Intermittent RF output from the driver tube due to intermittent plate voltage on the driver tube, the RF output of the 530 will also be intermittent.

I recommend checking the driver tube's plate voltage, pin 7 on the driver tube socket.

Connect a DC volt meter to plug 7 pin 4 on the RF UNIT. The voltage should be approximately 363VDC in receive and 320VDC in transmit.

Hello Mike,
I forgot to say what 300A it is the one on the IF board I will pull the board and check ti pins for a bad solder joint since when I touch it it makes the ALC meter jump all over the place. after that I will check the plate voltage for the driver tube. Thanks for your input on this. Then I will tackle the RIT not working on this rig.

23151. Re: TS-530S ALC Problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-29 17:55:33 UTC
From: w5rkl
Topic: 23148 Message: 23151

That's good to know.

The driver tube receives it plate voltage directly from the IF UNIT's plug 4 pin 1 "300A" connection.

As I stated before, if the driver tube plate voltage is intermittent the driver tube's RF output will also be intermittent which will lead to an erratic ALC meter indication in TUNE, USB, and LSB modes. ALC is not used nor will there be an ALC indication in CW-W or CW-N mode regardless of the RF output and where you set the CAR Control.

Once you fix the IF UNIT's plug 4 pin 1 intermittent connection that is causing the intermittent driver tube plate voltage, the ALC meter indication and RF output should settle down and operate normal. That assumes there are no other problems.

No, the external VFO will not make the TS-520 operate on 11 meters.

Unfortunately, I do not recommend nor would I support converting a TS-520 to operate on 11 meters. That's me, others may think differently.

The one I own was on CB when I bought it . As soon as I walked in the door after buying it years ago , the covers came off .

Luckily he had saved the original 10 meter crystal. In those days my ability to work on radios wasn't challenged .

However it took me all one afternoon to convert it back to 10 meters . Not an easy job to get to the crystal and then line things up.

I would NEVER consider putting one on CB .

That is both from the legal standpoint and the work involved .

Charlie , W5COV

YOU SHOULD NOT, UNDER ANY CIRCUMSTANCES, MODIFY A RADIO MEANT FOR THE AMATEUR SERVICE TO OPERATE ON THAT BAND! IT IS HIGHLY ILLEGAL, AND IF YOU WOULD GET CAUGHT OPERATING SUCH A THING, YOU COULD INCUR A LARGE FINE, AND NEVER BE ALLOWED TO OPERATE ANY OTHER SERVICE, EVER! ! !

That is the gosh awful truth, whether you want to hear it or not! No self respecting amateur radio operator should offer you the method to do this, if indeed there is such a method!

That's all I have to say about that !

Jim AG3Y (Amateur Extra Class since the early 1970s)

Well that was the problem Mike it was a bad connection joint at plug 4 pin 1, got that redone and that is all fine now. Thanks Mike for comfirming that for me. I also got the RIT/XIT working a wire was broken off the band swtich where the RIT wires are tied that goes to the VFO. The rig is like new again (Well alomst). Again Thaks

I would never put any real radio on 11 meters if you want 11 meters there are plenty of CB Radios that operate there buy one of them dont put your 520 there it's illegal for one thing and a lot of work for another. My first 520 was on 11 meters when I bought it for $75 in 1982 and I had to order the crystals install them and tune it back for 10 meters took most of the day to do it right.
My $.02 worth

Roland,

You're totally right on that. When I worked for SBE way back when, the CBers hated me. I was senior tech, amateur division, but when work was slow I was "forced" to work on their chicken band radios. When one would cross my bench with modifications, the first thing I did was rip them all out, fix the problem and have it shipped back to the owner. At one time I had a box that we weighed just to see how much junk I had removed from modified radios. If memory serves me, it was around 30 lbs. I received many letters and phone calls from irate clients griping about the missing mods. I had to explain the legalities of the situation and the consequences to my first class radio phone license should I have left the mods. I was threatened with law suits etc. Never did happen though. HI HI

NO, don't modify any amateur radio to operate on 11 meters!!!!!

ANYway, most CB radios have hotter receivers han a 520, since they are design optimized for that single band.

I would never put any real radio on 11 meters if you want 11 meters there are plenty of CB Radios that operate there buy one of them dont put your 520 there it's illegal for one thing and a lot of work for another. My first 520 was on 11 meters when I bought it for $75 in 1982 and I had to order the crystals install them and tune it back for 10 meters took most of the day to do it right.
My $.02 worth

Congratulations Roland,

You have graduated with a degree in Kenwood PWB manufacturing Quality Improvement. That connection was doomed to fail from the day it left the factory.

Reminds me of the Yaesu FT101E I had that would jump 8khz in cold weather. The radio was in my garage shack and it would fire up OK then jump 8khz after 5 minutes or so. An hour later when it was warmed up it would jump back 8khz and stay put.

I finally found the 9V regulated supply was jumping to over 10V. Why???

The regulator adjust pot was mounted on the pc board and soldered to the trace on the top of the board.

No solder on the bottom of the board and no plated thru hole. It was just pressed in there and totally intermittent. The factory did it....

23163. Can anyone here repair a DG-5 Display?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-30 12:02:46 UTC
From: ralph gee
Topic: 23163 Message: 23163

Well, I purchased a DG-5 Display from eBay and I got burnt. The unit doesn't work. Is there someone in the group that can take a look at this and see how much MORE it will cost me to get this operational? Or, point me in a direction?

Thanks in advance.

Best 73,
Ralph

THANK YOU ALL FOR YOUR HELP WITH THIS ISSUE.

Here's what's going on...

I plugged everything in and the display barely lit up. When It didn't work, I swapped out the RCA cables. When that didn't work, I tested the voltage coming out of my radio...14v,so good. Tested power cable..good. Connected counter to an astron power supply for alternate power source and it still lit up very very dim...you had to turn the room lights off to see a glimpse of it.
Also, from what I could see of the counter, it looked like it was throwing out random numbers.

When I get home tonight, I will print out the info on the web site and pull the cover to do a visual inspection. I hope it's something that can be remedied.

Thanks again in advance.

I am in search of a part. Kenwood part number V30-1081-06
It has a number on it of TMC1000 and is a Micro processor unit for the digital display on a TS-180S It is a 42 pin IC
Any of you part GURUs have any suggestions for locating this little guy?

Thanks,
Gordon

Karl.
You could always send it to me. ill put it on 11 meter for you.
my 11 meter bench that is.hihi
Why would any one want to put a perfectly nice radio on the CB band? really defeats the reasoning to holding a amateur radio licence. don't you think.
Dont do it Karl, as said by meany, if you want 11 meters go to the truck stop and buy one.

Ralph.
If you bought it off the EBay. and it's description doesn't match what you have. i would file a complaint with them and Pay pal. Have u contacted the seller? did you notify eBay and pay pal. did you post a strong negative against the seller.
I have been in the same boat, with a linear amp. how ever the seller did reimburse me with part of the selling cost. after all he described it as not DOA and it was.
Hope you get it fixed.
Dave kg4uxr.

Ralph.
If you bought it off the EBay. and it's description doesn't match what you have. i would file a complaint with them and Pay pal. Have u contacted the seller? did you notify eBay and pay pal. did you post a strong negative against the seller.
I have been in the same boat, with a linear amp. how ever the seller did reimburse me with part of the selling cost. after all he described it as not DOA and it was.
Hope you get it fixed.
Dave kg4uxr.

From: gazza2p
Topic: 23176 Message: 23176

has anybody replaced the 6146B tubes with the 6146W tubes.
I see there is a web site in the USA selling matched pairs of 6146W tubes for $39 US.
I have a TS-530S and would like to use the 6146W tubes if they are suitable.

23177. Re: [TS-520_820_530_830] new 6146 tubes

I still have some of the VFO cables for the Kenwood 520/820 Radios.
These cables are 30 inches long and fully shielded.
Cost is $25.00 each plus shipping via Priority Mail.
I also have the 9 Pin shorting plugs available for $8.50 each plus shipping.
Please contact me off list at n6wk@...
These appear to be very hard to find items.
The Cable can be seen here
http://www.n6wk.com/kenwood/520-820%20VFO%20cable.jpg

thanks,
Gordon

Hi,

I have used the 6146W and they work great,
be sure to neutralize the tubes before you
start transmitting. I got a few sets from
http://www.surplussales.com/tubes-sock-acc/TubeSpecials.html
new JAN circa 1985

the driver should not be changed unless it
is starting to go bad. don't toss the driver,
it may work fine in another radio.

in the files section of this group look for
Neutralization Procedure

** high voltage ** caution

Aye, it takes all sorts ;-)

FWIW the cathode resistors are so heavily decoupled that there isn't even a sniff of RF across them (and barely any AF). I fitted a couple of 5W wirewounds when the carbon comp resistors went phut in my TS-520 simply because it was what I had available (not driving a 500-mile round trip to the nearest electronics store) and it worked perfectly well - but I'm very very careful with it, as you should be with any slightly bodged repair. When I finally get the shack set up at the new place I'm going to get a couple of metal film resistors to replace it. Yes, there is a helical etch in the film to set the resistance so in theory they are inductive, but it's in the order of picoHenries.

If they had been intended as fuses then I suspect they would have been something like 2.5W "spring link" wirewounds, the ones with the bit of wire bent back and soldered on. These were extremely common in consumer equipment like TV sets at the time, and provided a crude thermal trip. In the event of overcurrent they'd heat up and melt the solder. Quite often they were made with special low melting point solder (not sure what the composition was) to spring a bit earlier. The resulting blob of solder hurled across the PCB would then contribute some other interesting faults!

If it's high-value stuff I only ever collect and pay in person. I appreciate that this may be rather more difficult to do in the US than the UK - as someone said to me at a computer thing recently, "You live closer to Turkey than I do to San Francisco..."

Hello All,
Update: Last night I pulled the cover off the counter and found a lot of dust. I hit it with canned air and powered it up. Didn't take long to find the bad solder joint and the display came to life. brought it into the shack and hooked it up to the rig and the display is not even close to the frequency that is on the rig. The only band that is close is 20 meters. Here's what I have:

RADIO DISPLAY
3.850.0 13.875.0
7.180.0 17.180.0 IN COUNTER MODE IT READS: 10.050.0 INSTEAD OF: 10.000.0
14.220.0 14.250.0
21.400.0 11.450.0
28.000.0 38.055.0 ALSO, THE DISPLAY IS SOMETIMES JUMPY, SHOWING ODD FREQUENCIES
29.100.0 39.100.0 I CLEANED THE RCA SLOTS AND CHECKED FOR GOOD CONNECTIONS

I looked in other places to see if there were any more bad solder points, but no luck. I am officially in over my head.
It looks like now I need someone's knowledge in, I assume, aligning the unit?? Or, perhaps, a more detailed eye in finding more bad solder joints that I cannot see.

So, it's back to being a paperweight. It needs help.

Best 73,
Ralph

My initial thought is the DG-5's reference oscillator is off frequency. See the DG-5 operator's manual, page 11, for details on calibrating the DG-5's reference oscillator.

If you do not have the DG-5's operator's and/or service manual(s), download them from Gordon, N6WK's website:

I feel quite drained now after reading that on the Eham forum. lol

I didn't think the resistors were sized to protect the tubes, the maths shows that that does'nt work, but if the tubes fail short circuit as they can, the resistors will fail and save the transformer. Unless I missed it no one seems to have mentioned that.

Hi,
Check out the 6146 family of tubes document in the files section. It seems
that not all 6146W tubes are the same. Depending on the date of manufacture
they can be A's or B's.

Ok, I'm not an expert, but I'm trying to replace my driver tube and it will not completely come out of its socket. Am I missing something? Tnx AI4NV.
ps. thanks to this group, my display is working fine now. was a bad connection in the connectors connecting both boards together. Thanks group!

23194. Re: [TS-520_820_530_830] TS 820 driver tube replacement

Hi,

This may be your problem. There a metal sleeve over the tube and this traps a metal strap against the glass envelope of the tube. The other end end of the strap terminates on the pcb. You need to remove the metal sleeve from the tube before removing the tube otherwise you're pulling on the metal strap.

23196. RE: [TS-520_820_530_830] TS-530 Cathode resistors on Eham Elmer forum

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-10-31 18:54:44 UTC
From: Dick Merryman
Topic: 23175 Message: 23196

The CAR pot on my TS-830S failed and I got max drive. The Ip meter pegged and before I could do anything, about 2 seconds, the panel lights dimmed and then the line fuse blew. After fixing the problem the Xcvr worked just fine, like nothing had ever happened. The cathode resistors remained at 5 ohms.

After that experience I don't worry too much about the power transformer; it is pretty rugged compared to the line fuse.

I feel quite drained now after reading that on the Eham forum. lol

I didn't think the resistors were sized to protect the tubes, the maths shows that that does'nt work, but if the tubes fail short circuit as they can, the resistors will fail and save the transformer. Unless I missed it no one seems to have mentioned that.

Hello Gordon & All,

Partstore.com shows it in stock w/ a ship time of 4 to 6 days @ 51.95. I have had good success w/ parts from them using Kenwood's original part #'s.

I hope this helps.

On the 6146w tubes, How can you tell the date it was manufactured by looking at the tube. Is there a Date stamped on the tube?

Subject: Re: [TS-520_820_ 530_830] Re: Can anyone here repair a DG-5 Display?

Hello All,
Update: Last night I pulled the cover off the counter and found a lot of dust. I hit it with canned air and powered it up. Didn't take long to find the bad solder joint and the display came to life. brought it into the shack and hooked it up to the rig and the display is not even close to the frequency that is on the rig. The only band that is close is 20 meters. Here's what I have:

RADIO DISPLAY
3.850.0 13.875.0
7.180.0 17.180.0 IN COUNTER MODE IT READS: 10.050.0 INSTEAD OF: 10.000.0
14.220.0 14.250.0
21.400.0 11.450.0
28.000.0 38.055.0 ALSO, THE DISPLAY IS SOMETIMES JUMPY, SHOWING ODD FREQUENCIES
29.100.0 39.100.0 I CLEANED THE RCA SLOTS AND CHECKED FOR GOOD CONNECTIONS

I looked in other places to see if there were any more bad solder points, but no luck. I am officially in over my head.
It looks like now I need someone's knowledge in, I assume, aligning the unit?? Or, perhaps, a more detailed eye in finding more bad solder joints that I cannot see.

So, it's back to being a paperweight. It needs help.

Topic: 23201 Message: 23201

I have recently moved into a new house and been given the blessing by my landlord to be able to put up a vertical antenna to use with my TS-520. I had been planing on building my own but have had some intresting changes in my work schedule and have decided to just buy a nice multi band vertical. So my question is witch commercial multi band ground mount vertical would be the best match with a TS-520. I am wanting to work 80-10 meters. I know the bandwidth of most of these on 75/80 is very narrow but that's ok as I will probably be on the higher bands more offen. I also know I will need a good ground radial system no matter witch antenna I end up with.

I have been looking at the Hustler btv series, Gap Challenger DX, hy-gain AV-18AVQII, and MFJ-1798. So far I think I am leaning twords the Hustler or the Hy-Gain. Most of the reviews of these I have found online are based off of using with a modern transistor final rig and not with the good ole tube finals of our beloved Kenwoods.

Any recomendations or advice would be appreacated.

Thanks
Kerry

Anything that will work with a solid state radio, will CERTAINLY work with a 520! The fact that a 520 will match a much wider impedance range than a solid state rig will, will even make it possible for you to work with a decent vertical antenna without resorting to an "antenna tuner" ! The Pi network tuning of the tube-type final will do the job for you, provided you do get a reasonable SWR on the antenna to start with!

If you wish to use phone more often, tune the lowest band toward 75. Likewise if you are more of a digital/CW guy, tune it to the lower portion of the band! A compromise can be made, but it will be a compromise, and you might end up with an external tuner, at least for 80-75.

Go with what seems the best for you, and don't worry about whether the radio will work with it. It certainly should !

73, Jim

kERRY
I noticed your statement that ground radials would be required-
that's not quite true.
When I had (and sill do) a problem with my tower mounted beams
I picked up a Cushcraft R7 that covers all bands 40-10. No radials.
Got me back on the air but I did miss 80 so I did two things got a used
18AVQ which does require radials but it wasn't very hard to do as the
specs called for only 4 or 6 multi wires , ie. 4 wire rotor control.
Cushcraft and I'm sure others make a vertical that doesn't need radials.
I also hung a quick dipole for 80 from the tower.

In that format the R7 is a vertical dipole not a true 1/4 wave vertical but the
R7 has been nice and good band width. R9 rings a bell and is a newer version
and if not standard I believe an 80 kit is available.
Mike

I have had a few verticals over the years, including some home brew monobanders and a few Huslers, but I have been using a Butternut HF6V for about 12 years and it is a good design for a multibander, this one has 30M where I started out with a MFJ QRP rig and worked much European DX with 5w.

I have recently moved into a new house and been given the blessing by my landlord to be able to put up a vertical antenna to use with my TS-520. I had been planing on building my own but have had some intresting changes in my work schedule and have decided to just buy a nice multi band vertical. So my question is witch commercial multi band ground mount vertical would be the best match with a TS-520. I am wanting to work 80-10 meters. I know the bandwidth of most of these on 75/80 is very narrow but that's ok as I will probably be on the higher bands more offen. I also know I will need a good ground radial system no matter witch antenna I end up with.

I have been looking at the Hustler btv series, Gap Challenger DX, hy-gain AV-18AVQII, and MFJ-1798. So far I think I am leaning twords the Hustler or the Hy-Gain. Most of the reviews of these I have found online are based off of using with a modern transistor final rig and not with the good ole tube finals of our beloved Kenwoods.

Any recomendations or advice would be appreacated.

Thanks
Kerry

I would recommend the Butternut HF6. I have been using oner (the HF5) for 20 years and have worked the world and it is still standing ok.

I misspoke earlier, "On the IF board (X48-1310-00) (facing radio, far-right board)" should read as "On the IF board (X48-1310-00) (facing radio, far-left board)", please make this correction in the Files section to the article titled "SM220 to TS530S". It was a long day when I wrote that and it was very likely at the time I didn't know my right from my left :)

Thanks/73,
Nathan/KJ4AUR

Please note that RFparts warns against using the W version in the Kenwoods. Don't know the reason behind it.

PS

I just checked and it refers to the GE version of the 6146W. Sylvania / Philips appear to be OK.

23212. Re: new 6146 tubes

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-01 05:41:37 UTC
From: Harry
Topic: 23176 Message: 23212

--- Earlier manufacture date (maybe)? Earlier tubes (6146W's are equivalent to a 6141A/6346!

There are actually three distinctive variants of the basic 6146: The 6146, 6146A, and 6146B. It is unfortunate that the 6146B was called the 6146B for it is really a different tube from the first two. Primarily the difference between the "plain" 6146 and the 6146A is the makeup of the heater ("filament"). The 6146A has what RCA calls the "dark heater". This "dark heater" is supposed to be more resilient to vibration, work well at a larger "range" of voltage, etc. Otherwise, the 6146 and the 6146A are the same tube.
In mid-1964 RCA introduced the 6146B with the "claim" of 33.33 percent higher power input than the 6146 / 6146A. Also, it was "claimed" that the 6146B could be directly substituted for the earlier tubes. The 6146 / 6146A had a maximum rated power input of 90 watts for CW and SSB operation and the 6146B had a rating of 120 watts for the same emissions.

If you wanted to read the full article by Glen E. Zook, K9STH,
Go to www.n6wk.com/kenwood/The_6146_Family_of_Tubes-1.doc

It will explain everything!

23213. TS-520 Shows no power out after HV Caps replaced..

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-01 05:42:02 UTC
From: whiteknight926

Hi group..

Well I use to have 100 Watts output on this TS-520. I have replaced the Highvoltage caps in it and after I fired it up I got nothing out now. The rig seems to recive ok but the rig shows no drive peak for ALC when I try to tune up, No Highvoltage with the switch set for HV, And the stangest in No Current Biasing to set for 60 ma. although when truning the screw on the side for it the rigs lights get brighter and dimmer with turning. I am Not shure where to start but I can say that there is highvoltage on the caps. After you turn the rig off and stick a piece of wire to ground to the shorting resistors on the tubes there is a nice blue spark...

Thanks
Dan

Dan,

I suspect your problem is a "wiring" issue. I recommend rechecking ALL of your wiring and compare it against the 520's schematic.

Since you have zero IP current (60ma meter indication in USB or LSB), that tells me you have one of the following problems:

1. SG switch has been accidentally set to it's "OFF" position.

or

2. No HV present on the final tube plate caps due to a wiring error.

The absence of a HV meter indication tells me you have a broken connection from the positive terminal of C18 and the HV UNIT's "800" terminal. You have already stated there is HV present at the filter capacitors. Therefore, a broken connection from the positive terminal of C18 and the HV UNIT's "HV" terminal will result in zero HV meter indication in transmit.

Absence of HV has nothing to do with the receiver. The receiver operates entirely from the Rectifier Unit's 14VDC supply. The 14VDC Rectifier Unit supply provides 14VDC to the FIX CH AVR UNIT where the various low voltages for the receiver are produced and distributed.

The dimming of the dial lamps tells me, as I stated above, you have a wiring issue. Again, recheck ALL of your wiring and compare it against the 520's schematic. I am sure you will find where you made a wrong connection.

Discharge ALL capacitors before performing wiring checks. Use an ohm meter and make continuity checks based on the 520's schematic, and you will find you wiring error.

I agree with Mike there is a wiring issue or the SG swtich is off but I would go with the wiring since you stated it would transmit before.
Start with the wire that goes to the terminal marked (0) on the 800V winding of the transformer that should go between the + on C31 and - on C32. Then check the wire that goes from the + on C32 to the 800 on the rectifier board (and 800 on the HV board)then from there it should goto L5 in the Final's. The - on C31 should goto ground.
Hope this helps

One more thing.

Do NOT be confused by the different HV capacitor labels. Roland gave "C31 and C32" and I said "C17" and "C18". They are the same capacitors just labeled different based on the 520 model. Take the time to study the schematic, trace your wiring, and I believe you will find your wiring mistake.

MC-50 - nice condition. 4-pin connector. Missing the small ON-OFF label on the barrel of the mic $45. Shure mic (similar in appearance to their 444) , w/ GE logo, wired w/ Knwd 4-pin connector, $18. Can provide photos. Joe k7mks

Hi Kerry. I would go with the Hustler 5BTV. Replace the
bolts/nuts/screws with stainless steel ones are you will be set for
many years to come. While many verticals will work without radials,
(elevated or ground), they ALL work better with than without them.

Just my thoughts...

23220. Re: TS-520 Shows no power out after HV Caps replaced..

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-01 19:01:12 UTC
From: whiteknight926
Topic: 23213 Message: 23220

Well I checked the wiring comparing it to another 520 and seems I have it right. I have also checked with the rig power on and there is high voltage all the way though the HV caps and to the top of the L5 Coil I am looking into what is next after this. I believe is something simple, I just have to find it...

Thanks
Dan

Dear Joe:

I have already paid you for this mic by Paypal...unless you happen to have TWO mics which fit the same description. Why are you now offering it for sale at a lower price????

Is there some problem with the Paypal payment not going through, and if so, why have you not contacted me, rather then putting the mic up for sale again?

Best Wishes,

Bernie Roche

23228. Re: TS-520 Shows no power out after HV Caps replaced..

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-02 13:10:40 UTC
From: w5rkl
Topic: 23213 Message: 23228

Ok Dan.

Tackle one problem at a time.

First problem, no HV meter indication.

You said the HV meter position, in transmit, shows zero volts. You did, however, say you measured HV at the filter caps and I assume that means you measured HV at the positive terminal of C32.

Having said that, if you have HV on the positive terminal of C32 but the HV meter position indicates zero voltage then measure the voltage on the HV UNIT's 800 terminal, it should be the same as the voltage on the positive terminal of filter capacitor C32. If the voltage is missing on the HV UNIT's 800 terminal then you have a bad or broken connection between the positive terminal of C32 and the HV UNIT's 800 terminal. Fix this and your HV metering problem will be eliminated.

Second problem, Lack of 60ma idling current.

You said you have HV at the top of L5. That's good. Now, measure the voltage at the top of L6, final amplifier's RF choke. It should be the same voltage at the top of L5 AND the same voltage at the positive terminal of C32.

If there is no HV on the top of L6 then that's the reason why you do not have any idling current in USB or LSB mode which is why you have no RF output!

By the way, don't be fooled into believing once you start seeing HV on the HV meter setting in transmit (any mode) that you should see RF output. The HV meter switch setting simply displays HV output from the HV supply. It does NOT verify that HV is being applied to the final tubes. A broken or bad connection between the positive terminal of C32 and L5/L6 will still show HV on the meter but there will be no HV on the final tube plates. No HV on the final tube plates results in no 60ma idling current and no RF output. This why I recommended tracing/verifying the wiring in your 520 and compare it with the 520's schematic. I do not recommend using another 520 to verify wiring as there could be modifications, changes, etc by a previous owner that may not reflect the same wiring as the 520 schematic.

Date: 2009-11-02 15:34:06 UTC
From: w5rkl
Topic: 23210 Message: 23229

Karl,

You might try cleaning the relay first before replacing the relay. Sticky relays can often be traced to dirt/dust build up at the armature pivot point.

If the symptom also includes weak receive when changing from transmit to receive, the problem is most likely caused by dirty relay contacts. Any dirt/corrosion/carbon build up on the relay contacts can affect signal flow through the relay contacts resulting in a weaker than normal signal being applied to the receiver's RF amplifier, hence weak receive. Cleaning the relay contacts in many cases can eliminate this problem.

What checks have you done so far ? Have you tried a different mike ? If it is an amplified mike , checked the batteries ? Audio gain properly set ? Checked solder connections on the mike plug to see that a wire isn't broken or shorted ?

I know these are "basic" items , but you didn't give much detail and sometimes we often tend to overlook the basics , just assuming they are ok .

Bill,

Here's a tip for leather straps. Measure the center-to-center hole dimensions. Then go to Antique Electronic Supply (www.tubesandmore.com<http://www.tubesandmore.com>). They sell many varieties of leather straps with chrome end caps for guitar amps. You may find one that works.

I am sure the experts on here will get you going Gene .

I often see them talk a person through the problem right down to the exact component . I can't do that . They perform those amazing feats almost daily !!

They are an amazing and wonderful group of guys .

I will be following it to its successful completion . That is another great thing about this group , is you learn the problem and the troubleshooting to fix the problem.

Good Luck !!

Charlie , W5COV

It worked on SSB while listening to monitor a few weeks ago, while testing the mic. But now nothing, just tunes up and no audio.

Have you tried a differnt mic? Do you get any ALC indication when you tune the radio? See if you get a signal on Q19-22 and D31-34 on the IF board, if the signal stops anywhere in that area replace the componet where it stops. Then start again.

23243. Re: Radio keys up but no audio

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-03 03:03:46 UTC
From: w5rkl
Topic: 23234 Message: 23243

The TS-820's FSK mode does not use audio shifting tones to produce the RTTY signal. The RTTY signal is produced by shifting the CARRIER UNIT RF signal 170hz or 850hz depending on the NARROW/WIDE plug placement on the side of the CARRIER UNIT.

The TS-820 CW sidetone does not flow through the monitor circuit and monitor switch. The CW sidetone is produced on the FIX-VOX UNIT and fed directly to the AF AVR UNIT where it is applied to the main receive audio amplifier, Q3, then directly to the speaker.

Check for the presence of audio at TP2 on the IF UNIT. Lack of audio at TP2, with the MIC gain set properly and in transmit, indicates a possible failure in the speech amplifier, Q20 or Q21. Don't rule out a shorted microphone wiring, pin 1 on the microphone socket, broken wire on IF UNIT IF4 pin 13 etc, broken wire on the MIC gain pot, or any other broken or poor connection in the audio circuit. Trace the audio signal using an oscilloscope from the microphone socket, pin 1, through the speech amplifier Q20 and Q21 to TP2. See the IF UNIT and high resolution schematic available at N6WK's website:

http://www.n6wk.com/kenwood/

to see how the audio signal flows from the microphone through the speech amplifier to the balance modulator.

Greg,
Thanks for the tip, but the problem is even more simple! The strap is in good condition, but the radio is missing one of the metal ends that secure it. All I really need is the hardware set from one end. Thanks so much for your tip.

Bill,

Here's a tip for leather straps. Measure the center-to-center hole dimensions. Then go to Antique Electronic Supply (www.tubesandmore. com<http://www.tubesand more.com>). They sell many varieties of leather straps with chrome end caps for guitar amps. You may find one that works.

Greg

Check your microphone connection, I had once a microphone plug, that you could insert either way, even upside down if you was uncareful.
The center part was smaller than usual.
After I had the set moved, I have searched for hours for that.

If it worked before, retrace your steps, it should work now too.
There are seldom problems in the audio part, mostly broken wires or low batteries in the attached microphone.

Hello All,

Does anyone have a TS-830S for sale near the Metro Philly area???

I currently have (and throughly enjoy) a TS-520SE,and I was close to purchashing an 830 but, the guy sold it.

So, I'm asking here if anyone has one of these rigs for sale??

please contact me @ k3fxr at arrl

Thanks all.

From: aschichler
Topic: 23249 Message: 23249

If anyone needs an MC-50 mic stand, I have an extra one that I will sell cheap. It has the cord that goes from the stand to the mic, but not the cord that goes to the transceiver. Nice condition, slightly yellowed keys.
$10 or make offer.

I can provide photos if needed.

Mike w5rkl,

After installing N.O.S tubes in my 520S I let them "Burn In" for afew hours. When I tuned them up for the first time, The nuetralization seemed real closed, but the MA meter is reading 270 instead of the 225 normal reading and the power out is about 130 watts. Isn't that to many Miliamps for the tubes to draw during key down, but what can I do to lower the MA'S.

Thanks
ki0gv
Mike

Hi Mike,

Its difficult to tell unless we know whether or not you are running into a dummy load or an antenna? Which band? Where is the loading control set? 270ma would be possible to get 130Watts output but I wouldn't run those tubes at that high an output power for long. As a comparison, I load my 520SE to around 220ma on 75 meters into a dummy load with 100 to 105W output. The plate dip with the loading control counterclockwise goes down to just under 200ma with about 85W output at that level. Then I increase loading slightly to get to 220ma and 100W.

Al,

Are the PTT and Lock functions working on the stand? I have a good MC-50 but the switches are broken.

Ed, W9EJB

Subject: [TS-520_820_530_830] Extra MC-50 mic stand available (no mic)

If anyone needs an MC-50 mic stand, I have an extra one that I will sell cheap. It has the cord that goes from the stand to the mic, but not the cord that goes to the transceiver. Nice condition, slightly yellowed keys.
$10 or make offer.

I can provide photos if needed.

Al, WA2AS

Greetings all,

After a lot of work on my radio, I am at a point where I need help.

First off, it powers up and is able to recieve. I tuned to 10.000 and was able to hear the clock thingy.

I have replaced the tubes in the radio. The fellow I got it from said that he pulled the radio out of service due to bad finals. I have replaced them and the driver tube as well at this point.

Someone at some point in the past also did some "mods" to the radio which have been undone as well. Note: I could not find any recognized Mod for this radio that required the changes that were made.

Anyways, at this point, using k4eaa's tuning proceedures, I get a big fat zip. I set the following:

Mode: tune
CAR: 5/8ths or so
LOAD: minimum
BAND: 28 (only a tech so far don't want to broadcast outside my range)
Tuner: 28.300
Meter: ALC

When I flip the SEND switch, I get no reading on the meter and I get nothing on my SWR/Power meter that I have inline with my antenna.
Tried moving the Drive, per instructions, nothing. Tried maxing the CAR control, also nothing.

The switch on the back was tried in both positions also tried rotating the pots as well.

I am at a loss at this point. Anyone have any ideas?

With regards and 73's
KF7AYS

Sorry to say but it sounds like a CB'er got a hold of this rig. Have you checked to see if the correct crystals are in the radio and not those for 11 meters?

First try the Load at 12 o'clock if that is not it check the HV turn the meter to read HV then put it in send should be 800+ volts. If not it needs the HV caps replaced. Since the 830 is a PLL radio not cyrstal control it only has 2 for IF refernce USB/CW & LSB. Another check is put the radio in SSB the meter to IP hit send do you get any reading on the meter? if not the HV section needs looking at.

Hello Mike,

Greag has covered it quite well.

I wonder what you meant by

"I let them "Burn In" for a few hours"

when referencing the driver and final tubes.

73's

The voltage at the tops of the final tubes is right at 953v.

The Load setting does not seem to have any affect.

Potentially a stupid question, so take no insult from it, but do you have CW key or a shorted key attached to the CW key jack on the back of the 830?

Greetings all,

After a lot of work on my radio, I am at a point where I need help.

First off, it powers up and is able to recieve. I tuned to 10.000 and was able to hear the clock thingy.

I have replaced the tubes in the radio. The fellow I got it from said that he pulled the radio out of service due to bad finals. I have replaced them and the driver tube as well at this point.

Someone at some point in the past also did some "mods" to the radio which have been undone as well. Note: I could not find any recognized Mod for this radio that required the changes that were made.

Anyways, at this point, using k4eaa's tuning proceedures, I get a big fat zip. I set the following:

Mode: tune

CAR: 5/8ths or so

LOAD: minimum

BAND: 28 (only a tech so far don't want to broadcast outside my range)

Tuner: 28.300

Meter: ALC

When I flip the SEND switch, I get no reading on the meter and I get nothing on my SWR/Power meter that I have inline with my antenna.

Tried moving the Drive, per instructions, nothing. Tried maxing the CAR control, also nothing.

The switch on the back was tried in both positions also tried rotating the pots as well.

I am at a loss at this point. Anyone have any ideas?

Hook the radio to the Dummy load and check the voltage in transmit it should drop to 800+ volts. If it does not then you are not getting any drive, check the resistors on the final board R2-5 they are 20ohm 1/2 watt. If they are ok check pin 7 on the driver tube for voltage 330+ RX 290+ TX. Also check pin 3 on the final tubes for 250V+/- RX 220+/- TX.

What reason did the previous owner give to indicate the final tubes were bad and needed replacing?

The test result you provided is for one band ONLY which is insufficient to determine the complete health of the 830.

I suggest connecting the 830 to a dummy load and perform addition transmitter output tests on ALL bands. The results obtained will provide a much better indication of the overall health of the 830.

>
> The switch on the back was tried in both positions also tried rotating the pots as well.

The only switch on the 830's rear panel is the "SG" switch located below the fan. This does NOT include the micro switch embedded in the VFO DIN socket. A failure in the micro switch on the VFO DIN socket will result in a blank, dark, digital display.

>
> I am at a loss at this point. Anyone have any ideas?

I do not see where you have checked the final tube cathode resistors, R2 thru R5, unless I missed it in a previous post. Have you checked R2 thru R5?

Topic: 23254 Message: 23263

Hi Ron. Try this first. With the radio connected to a dummy load, set the frequency to 28.400. Turn on the calibrator. You should hear a whine. If not, tune up or down slightly until you do. Adjust the Drive control for maximum meter reading. Turn off the calibrator.

Set the meter switch to ALC. Set mode switch to the Tune position and the CAR control to about 9 o'clock. Key the radio with the Send/REC switch, and see if you get any ALC reading. If not, turn up the CAR control and see if that helps. Do NOT leave the radio keyed for more than 10 seconds at a time!

Let us know what your results are.

No reason given for the tubes being bad.
Test results are the same on all bands.
Resistors tested and good.

Thanks again,
Ron

How do I get to the pin on the driver tube? There is no access under the board.

Thanks
Ron

No, I do not. The tuning instructions make no mention of using one.

Thanks
Ron

Pull the tube then test for the voltage. test the voltages on the rectfier board. Do you have a service manual? if not you should be able to download one from the user group page. the calibrator is the mic gain turned all the way left until it clicks.

Thanks for your opinions guys. It looks like right now I will be going with the Hustler 6btv. It looks like this one will work out nicely with both the 520 and my K2 qrp rig.

Kerry
KE5OFO - Weatherford OK.

Topic: 23254 Message: 23271

I suspect that's MAY be issue there, I too use Ken's tuning instructions, and I've always had to use one when tuning else there is no transmission. Using 1/4" mono jack shorted tip to shield, I don't do CW.

Always had to do that with the mode setting in CW to set IP and LOAD to ~225mA after dipping the plate and peaking the ALC in TUNE mode.

Honestly, never tried it without the shorted key attached in TUNE mode. Not sure if it's even required, I'm reading the 830 manual there and I don't see it mentioned, only during the CW mode setting.

Are you able to see/set the bias to 60mA too?

Here's a great place for manuals, http://www.n6wk.com/kenwood/

Sometimes the ALC meter does not move even with the CAR set to the maximum especially on 10m band. It seems to be an indication of a weak drive tube.

This is what I would try if you have not done this yet:
Set the meter to IP. TUNE and see if the meter moves (up to somewhere between 60mA and 120mA?). If so, try to dip it using PLATE. Set the meter to RF and TUNE to see if you have any output. Use DRIVE and LOAD in any order to see if you can maximize the output.

Ok, the driver tube voltages are as follows:

1: 0.0
2: 250.6
3: 344.9
4: 0.0
5: 0.0
6: 0.0
7: 0.0
8: -48.8
9: 0.0
Center: 0.0

The presence of a 1/4 inch mono plug, shorted or not, that is inserted in the CW socket has no affect on the RF output in "TUNE" mode, only in CW mode.

23278. Re: TS-830s issues

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-04 23:23:54 UTC
From: w5rkl
Topic: 23254 Message: 23278

Ron,

You looked at the tube pins incorrectly.

Here's what the approximate driver tube voltages should be:

Pin Xmit / RCV
1... +4.6 / 0.0
2... +0.4 / -43.6
3... 0.0 / 0.0 (grounded)
4... N/A / N/A
5... N/A / N/A
6... N/A / N/A
7... +297 / +339
8... +185 / +241
9... N/A / N/A

"N/A" means the pins are not used.

These voltages are on the TS-830's high resolution schematic of the RF UNIT. The voltages are in RED. Transmit voltages are in enclosed in parens while receiver voltages are not.

I recommend checking the voltages indicated on the high resolution schematic in both transmit and receive. The voltage readings will give you an idea of what is working and what is not.

Here's an example of what could happen.

If, while measuring the driver tube grid voltage, pin 2, you notice the voltage does not change from -43.6VDC in receive to +.4VDC in transmit, the problem is on the AF UNIT, possibly due a bad relay RL1 on the AF UNIT.

In transmit, the AF UNIT's RL1 relay grounds "VR3" voltage on plug 5 pin 1 causing the "DRB" (DRiver Bias) voltage, AF UNIT plug 6 pin 5 to change from -43.6VDC to +.4VDC. If the "DRB" voltage remains at -43.6VDC, whether in transmit or receive, the driver tube will remain biased to "cut off" which leads to no RF output from the driver tube, no ALC indication in TUNE mode regardless of the CAR control setting, and no RF output from the final amplifier. This could be caused by a bad relay RL1 on the AF UNIT, it may not be energizing. In short, the "VR3" voltage MUST be grounded in transmit before the DRB voltage will change. No grounding of VR3 voltage results in no change in DRB voltage, and so on.

Now, the above example is just that, an example ONLY and does not reflect the actual problem you are experiencing with your 830. It's simply a discussion of how to check voltage and note the changes, if any, that should occur and what to look for if the change does not occur.

Well I got it finally. Turns out after a cleaning on relay RL-2, I guess I cleaned it a little to much... I guess after my cleaning an adjusment because of it sticking and not going back too recieve it wasn't even ingauging and keying the radio, It looked like it was moving ok but after pulling the relay out of a spare parts radio and relacing it with the other relay its keying and I now have power output. Wish I knew a little more about relays and how to adjust them the right way.. Oh well...

Hi Ron. On the TS-830S, the calibrator is turned on by turning the mic gain control all the way counter-clockwise. The calibrator gives a signal every 25Khz on the dial. Look on page 10 of the TS-830S manual under item 19, Mic gain control.

The manual doesn't say much about it at all. You do know that the Drive control peaks the receiver sensitivity in receive mode? Once you have done that, the Drive control should be at (or near) peak for transmitting on the same frequency. The peak receiver sensitivity and peak ALC reading should be at the same setting on the Drive control. If not, the alignment of the coil pack may be slightly off.

What I was trying to find out from you is if you get any ALC reading.

Mike w5rkl,

What I meant by the term "Burnt in" Was years ago you would have to leave the tube on for a while before putting the voltage to them, to make sure they would be ok. That's what a tech. told me years ago. Escpecially tubes that had been in storage for a extended length of time.

Yes it is possible to "clean" a relay too much. Many relays have a silver coating on the contacts, and they should NEVER be filed, or even burnished if the are highly tarnished.

An old fashion method of cleaning relays involves some alcohol and some rough paper, nothing harsher. You simply pass the paper between the closed contacts until it no longer shows any black streaks when being pulled through. Of course, if the contacts are Normally Open, you would press on the armature of the relay to close them as you pass the paper through them. And naturally, do not do this with any voltage applied to the rig!

The combination should eliminate any oil or other buildups such as cigarette smoke that may affect the continuity of the contacts.

If you file the contacts, you will distroy that silver coating, and all bets are off as for the relay working properly!

Good luck! Jim AG3Y

23292. TS-830S unstable RF problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-05 15:33:26 UTC
From: aschichler
Topic: 23292 Message: 23292

I have a TS-830S that I acquired recently, and I've been going through a basic overhaul (cleaning pots, switches, connectors, tightening screws, etc., and aligning everything I can).

Anyway, after fixing a bad solder joint on the driver tube socket, I proceeded to align the driver and RF/Ant coils. At some point, when I was aligning the driver coils, I found that putting pressure on the RF board changed the ALC reading, so I decided to poke around to see what might be causing that. Then I found that every time I put pressure on T4 (IF transformer), the reading changed (a lot) and needed re-peaking, so I resoldered all the connections on T4, which made no difference. Finally, I removed T4 and took it apart. It looked ok, but I figured it couldn't hurt to re-solder everything inside, so I proceeded to do that, using a jeweler's loupe. After I installed it back in the RF board, it seemed a little more stable, but putting downward or sideways pressure on T4 still changes the ALC reading some, and I had to go and re-tune the slug if I want it tuned for maximum ALC reading.

Anyway, I was just wondering if anyone has run into anything similar, and if I should try to replace T4. (Maybe it's just that T4 tunes very sharply, and any pressure on the can changes the inductance enough to make a significant difference).

Sorry for the long post. I would appreciate any comments or suggestions.
Thanks,
Al, WA2AS

23293. Have gone mobile w/TS-520s - NEED HAND MIKE !!!

Gang,

I recently went mobile with a TS-520s - yes, I have the AC/DC version, and I am in need of a good mobile mike. Will consider also consider a headset

I don't remember the model number of the hand microphone that was originally supplied with the radio so I could use some help from you TS-520s specialists out there.

I have a good mobile CW key (that little USSR military one mounted on a stamped metal disc with a leg strap) - barebones - but works GOOD !!!

Any and all assistance would be appreciated - Thank you !!!

Hi Al,
Yes, I have run into similar situations.
Check the Caps VC1, VC2, VC3 where they solder to the RF board. A small hairline crack at one of the 5 large pads will cause your problem.

Hi Guys. Actually, any properly wired mic or headset with an appropriate mic impedance can be used. That said, I prefer the stock Kenwood hand mic, or the MC-50. I am fortunate to have the appropriate stock hand mics for my Kenwood TS-430S (MC-42S), and my TS-130SE (MC30S). I wish I had the stock mic for my TS-530S. That one has an old hand mic (brand unknown), but I get good audio reports. And of course the MC-50 gets good audio reports with any of the 3 radios.

Hello Mike,

I suspect you are talking about eliminating "gas" in the tube. Unfortunately, in most, not all, vacuum tubes, filament power ONLY will not eliminate gas.

External anode tubes such as 4CX150, 4CX250, 8877, and other such tubes, however, have a gas absorbing coating that is applied to their filaments.

Small receiving, low and high power glass envelope tubes do not have this gas absorbing coating applied to their filaments.

External anode tubes such as the one listed above, have their filaments coated with a getter material that, when filament voltage is applied, the heat produced in the filament causes the getter coating to absorb gases in the tube. HV and cathode current is restricted during this process and the process take a minimum of 3 minutes. This procedure is required each time the tube is placed in service. That means every time the equipment these tubes are used in, is powered on, the minimum 3 minute warm-up period is required before applying HV and allowing the tubes to conduct (cathode current). Failure to follow this "warm-up" period with these tubes can result in internal arcing that can easily destroy the tube.

High power glass envelope tubes such as the 811/811A, 572B, and 3-500Z, along with a number of similar type tubes, do NOT have a "warm-up" or "burn-in" period like the external anode tubes do. These tubes do NOT have their filaments coated with a gas absorbing material either. These tubes have their "anodes" coated with a gas absorbing material, typically Zirconium. Zirconium, when heated to a high temperature, typically 1200 degree centigrade, absorb gases in the glass envelope. The filaments of these tubes cannot heat the anodes to this high temperature. The only way the anodes can be heated to this high temperature is with current flowing in the tube, normal operation occurring. A typical indication the anodes have reached this high temperature is the anodes show a dull red or amber color. This is normal and should not be considered a failure of the tube or the circuit the tube's operating in. Operating these tubes without color showing on the anodes can, and usually does, lead to reduce life span.

Small receiving and low power transmitting tubes such as 6146, 6AU6, 2E26, and others do not have their anodes or filaments coated with a gas absorbing material. Gases are absorbed from a getter element containing "Barium". During the last stages of manufacturing the getter element, some shaped like a "halo" mounting on a long metal support while others appear like a square that is mounted inside the tube and at the base, hold the getter material which is typically Barium. After the tube has been sealed and during the degassing process, the getter is heated to a high temperature, typically by an RF induction coil place around the tube. This results in a "getter flash" that causes the chrome like "mirror coating" on the inside of the envelope next to the getter element. This chrome like mirror coating signals a good vacuum exists. A loss of vacuum is indicated by the coating turning "white". Discoloration of the coating is NOT a sign the tube is failing as some may think. Small receiving and low power vacuum tubes should NEVER show color on their anodes. Any color showing on their anodes is an indication there is a major problem or you are severely over driving the tube(s)!

For more information on vacuum tubes, getter process, degassing, and how vacuum tubes work, log onto one of the following websites:

Hello to all

Let me just say one thing about NOS tubes laying around for years. In the mid 70's, Bill Orr gave me 4 Eimac 3-500Z tubes. They were kept for for 30+ years. I sold 2 of them with an old SB-220 amp. The last pair were installed in a Drake L-4B that I bought without tubes at a very good price. I found my NOS tubes, plugged them in, turned on the amp and began using it. That was two years ago. Never a problem, and I still use the amp on a daily basis. I still think it's a myth that you can't use tube that have been stored for many years. I've done it for close to 50 years!

Just my own opinion. We are entitled to have them still.

I'm using the MC-10 with mine - it came with a TR-2300 that I
occasionally use for packet ;-)

No complaints and quite a few compliments on the audio - including one
OM who commented that my audio "sounded like a hybrid Trio - got that
Kenwood sound - wonder what model you've got there?"

23305. TS-520 transverter question

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-06 05:59:04 UTC
From: loewensteijn@rocketmail.com
Topic: 23305 Message: 23305

Can someone tell me the output of the TS-520 transverter out that is used for driving the 144-146 Mhz transverter?

Alternatively, if someone can measure the RF voltage on the transverter out connection at 28-30 Mhz that would be of a great help too. If you decide to measure please let me know the output level of the TS-520 that you measure this voltage at.

Many thanks in advance,
Marinus, ZL2ML

The unprinted area of a business card pulled between the contacts will usually do a good job of cleaning without damaging the contacts.

Yes it is possible to "clean" a relay too much. Many relays have a silver coating on the contacts, and they should NEVER be filed, or even burnished if the are highly tarnished.

An old fashion method of cleaning relays involves some alcohol and some rough paper, nothing harsher. You simply pass the paper between the closed contacts until it no longer shows any black streaks when being pulled through. Of course, if the contacts are Normally Open, you would press on the armature of the relay to close them as you pass the paper through them. And naturally, do not do this with any voltage applied to the rig!

The combination should eliminate any oil or other buildups such as cigarette smoke that may affect the continuity of the contacts.

If you file the contacts, you will distroy that silver coating, and all bets are off as for the relay working properly!

Good luck! Jim AG3Y

Well I got it finally. Turns out after a cleaning on relay RL-2, I guess I cleaned it a little to much... I guess after my cleaning an adjusment because of it sticking and not going back too recieve it wasn't even ingauging and keying the radio, It looked like it was moving ok but after pulling the relay out of a spare parts radio and relacing it with the other relay its keying and I now have power output. Wish I knew a little more about relays and how to adjust them the right way.. Oh well...

I have heard of people using dollar bills to do the same job, but I would think that the ink would leave its own deposit behind (no pun intended !)

If you print your own QSL cards on blank card stock, that would be a great source for the paper. Especially true if you use the mat surface cards.

Another good cleaner is a cut up section of a plain brown paper shopping bag. It is a little trickier to get it thru the contacts, but the abrasion factor is the same as a business card.

23309. Spec-ing LEDs as panel lamp replacements

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-06 15:50:33 UTC
From: ganders52
Topic: 23309 Message: 23309

I am considering using LEDs instead of lamps as replacements for panel lamps in my radios going forward.

My question is how bright an LED should I use? What I see is that LED's are rated in "mcd's" which I know nothing about. Does anyone have a recommendation as to what range of brightness would be useable to replace dial and S-meter incandescent lamps?

I already know how to calculate dropping/current limiting resistance required, I am just ignorant about the "mcd" stuff.

Thanks for your help,

Greg
KG6YV

mcd is a measure of INTENSITY so for a given led chip and current, a narrower beam width gives a higher intensity / mcd.

I'd go for 120 degree (or thereabouts) leds, any 20 mA device should be bright enough to read a dial ... too bright may not be good.

I used the dollar bills to wipe my pool cue, leaves just that nice surface behind. In this case be sure to use a new dollar bill because old ones have lots of muck (grease) on them. There are area's in Asia where they wash the bills to make them look newer. Those are the best to use. (no pun intended).

Actually dollar bills are not true paper, it is some form of linen which is why they last so long. Every curency has its own compound which is often used to determine counterfeit attempts.

Marinus

23314. LEDs as panel lamp replacements - figuring dropping resistor values???

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-06 22:14:07 UTC
From: Howard Weinstein
Topic: 23309 Message: 23314

Hi Greg,

Excuse my ignorance but how DO you calculate dropping esistors for LED's? I guess in most cases I'll be dealing with 12 VDC. For some reason 220 ohms rings a bell with me...
Can you help?

Tnx es 73 de Howie K3HW

I am considering using LEDs instead of lamps as replacements for panel lamps in my radios going forward.

My question is how bright an LED should I use? What I see is that LED's are rated in "mcd's" which I know nothing about. Does anyone have a recommendation as to what range of brightness would be useable to replace dial and S-meter incandescent lamps?

I already know how to calculate dropping/current limiting resistance required, I am just ignorant about the "mcd" stuff.

Thanks for your help,

Greg

Find the forward voltage of the led and the current that is considered to be "normal" for the device's average light output. That is "I"

Take the supply voltage and subtract the forward conducting voltage of the diode. That is "E" in the equation.

Using Ohms law R = E/I , calculate the resistor ! That easy !

Here is the way to calculate the dropping resistor.

1. Determine the operating voltage and current for the LED you will use.

2. Use 13.8 volts DC as the source. Be sure that the source voltage is
DC not AC.

3. Here it is.

13.8-(operating Voltage of the LED)/Operating current of the LED=
resistance of the dropping resistor.

1/8 or 1/4 watt resistor will work just fine.

Example:

LED operating voltage=3.5VDC
LED operating current=200ma

13.8-3.5/.2=51.5ohms

Hope this helps.

Jerry

it really depends on the LED itself high/low Intensity ECT best to check manufactures spec for current draw just to be sure as it varies, the ones i used draw 30ma

I've got some LEDs here that draw 2000mA (yes, really 2A). They are on an aluminium plate about the size of a 50p that needs to be screwed to a heatsink.

They're too bright to use as panel lights.

The actual LED capsule is about 6mm across and slightly flatter than hemispherical. There's a plastic base about 8mm across that it clips into, and four wee fat surface-mount leads that go to the connection pads on the base.

Hi all, It is funny that many of us are in the same boat with rigs at Ken's shop awaiting repair. I have a buddy who took my TS-530s from New York to Fla rather than ship it (he makes the run regularly). He met Ken in person and said that he is a really nice, regular guy. I have also spoken with Ken, in fact about 3 - 4 days ago. As usual he was very helpful, polite and patient. He said that he is absolutley swamped with work. My buddy said that his garage is virtually floor to ceiling with rigs. Ken said that he averages two radios per week. Ken said that he is unable to presently return the large number of emails that he has in que. If he takes time to do that, he is not fixing the rigs. He is also training an apprentice to help meet the demand which also takes time. I am just going to be patient and know that when I get the rig back it will be "right" and will function as well as it ever did. I hope to have mine back before Christmas. The wait is a pain in the patootey but I have gotten burned by a popular Drake repair man who rooked me but good! I don't think this will happen with Ken. He seems like a true professional. Keep the faith. 73's Peter

ps: do any of you guys visit a regular spot on the General portion of HF phone?

I just placed an order with Ken via email and he responded the next day. I followed the procedure described on his website www.k4eaa.com/parts.htm - the BIG YELLOW BOX at the bottom of the page. I sent him a list of the parts I wanted, told him I would pay by PayPal, and he responded with a PayPal invoice ... all exactly as he describes in the BIG YELLOW BOX. It's a good system.... and it would have worked just fine... EXCEPT that I screwed up and didn't tell Ken that my PayPal account is a different email address than the return address that shows up on my emailed order. And PayPal... quite correctly.... wouldn't allow me to pay an invoice that wasn't made out to my correct account. When I advised Ken of the problem he was very gracious and very prompt in cancelling the old invoice and issuing a new one. There's two things to be said about this:
(1) When ordering from Ken, follow the procedure described on his website. It works very well, and no doubt it requires the minimum amount of Ken's time to process the order.
(2) Be sure your current email address is exactly the same as your PayPal account. If not, be sure to tell Ken the correct email address (PayPal account name) to use for the invoice.

I've made this mod to 4 rigs so far (A 520S, 820S, 830S, and a 440S). I use a 1/4W 470 ohm resistor in series w/ the LED. I found a source of "soft white" LEDS that draw a max of 35mA. On the 830, I decided to try using SMD resistors and it was easier that I had suspected and a lot more compact.

Don't forget that unlike traditional lamps, you need to pay attention to correct polarity when using LEDs.

I have a new to me TS820S.
The first two weeks everything has worked and funtioned perfect- 100%.
RX-TX all buttons and funtions.

Three days ago I hooked up an external 820 VFO. All worked well except for a loose connection on one of the cord connectors. I had to jiggle it for it to have a good connection. Then all funtions worked fine between radio, tx/rx etc.

Yesterday the rig went deaf. I removed the external VFO thinking that was the issue, put the jumper back in and still no RX. I pushed the RIT button and faintly heard a signal. Currently the button makes no difference on or off. I hear very very faint signals on 40 and 80 meters. My antenna is good---tested it out on 2 other radios.

There is no deflection on RX on the meter. I was tuning the rig on 80 meters and put a call out to see if the meter was working. It worked fineon TX and I heard someone respond to my call sign. I could not hear enough to continue.
Meter works when testing HV---that is fine also.
With the RF gain turned up all the way and tuning the bands I can bairly make out a few signals.....but for the most part I only hear noise similar when the antenna is un hooked.

I could use any help/knowledge/advice/ideas and solutions to fix this RX issue.

Thanks for your time and help.
Mike

23332. Carrier Control on TS-520

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-08 19:41:02 UTC
From: Dan
Topic: 23332 Message: 23332

Has anyone ever experienced a carrier control on a TS-520 that starts out high and as you are suppose to be turning the carrier up higher it goes lower in the middle of the pot and as you keep turning it goes back higher agin ???

This makes me think the pot is bad but I checked it on another 520 with a volt ohm meter and it does the same thing...

Thanks
Dan

Hey all,
I have a TS-520SE that has SSB and CW filter installed. The CW filter works great, but the SSB filter doesn't work at all. Reading the manual is says " move the brown lead from the SSB terminal to the CW terminal" Is this an either or setup, meaning you can use the SSB filter OR the CW filter but not both?

Thanks
Herb KC5MO

Yes, that's correct. You can only select and use one filter at a time.

The filters are selected by forward biasing the filter select diodes (each filter has 2, one for the input side and one for the output side) on the IF UNIT. That is what the wiring changes are for when installing the CW filter. Check the 520 schematic to see how this is done.

Hi Mike , I apologize , for needing a clarification here . It is most likely clear to the others , but I do suffer from some memory issues .

I have the TS-830S and have a
YK-88C , that came separate from the radio , that I had intended to use when I operate CW .

Does this mean , that I should just leave the filter out , if I also intend to operate SSB or does it just mean that two filters can not be selected at the same time , for the particular mode of operation ?

THANK YOU , and again I apologize for what probably appears to be a question already answered .

I still recall the day my TS520 CW filter arrived in the mail.
I just purchased the new 520 on closeout as the S models hit the store shelf. Came without the CW filter.
After getting it home and hooked up I discovered that on CW it was so broad recieving that it was nearly useless to me. I got on the fone immediately and ordered the 400 hZ filter.
I recall moving the brown wire that allowed the new filter to be selected by the mode switch. when you switch to SSB (I rarely do) the SSB filter is automatically selected.
See U on CW !

Charlie

If you put the CW filter in the rig correctly (you have to move the brown wire as stated in the manual) then on SSB the SSB filter will be used and on CW the CW filter will be used.

Hope this clarifies,
Marinus, ZL2ML

Charlie,

If the 830 does not have the CW filter installed but you have the CW filter in hand, install it. Follow the installation instructions in the manual.

Again, you cannot select both sideband AND CW filters at the same time.

Topic: 23346 Message: 23347

The "88" in the filter identification number denotes the "IF" frequency. In the case of the YK-88 filter, it is the "8.83Mhz IF" filter.

There are 2 of the YK-88 filters:

1. YK-88C - 500Hz CW filter for the 8.83Mhz IF. (Mode switch CW-W setting)

2. YK-88CN - 270Hz CW filter for the 8.83Mhz IF. (Mode switch CW-N setting)

See page 24 of the TS-830S operators manual for installation instructions.

23351. Kenwood 599

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-10 22:18:22 UTC
From: Robert Musser
Topic: 23351 Message: 23351

Thank You Jeff for the posting requesting help with my project.

My name is Bob and my Call is KB6KPK. I own a set of Kenwood twins and have for a very long time. They were original with the 2001 tubes in the final. I picked them up in the 70's because the Heathkit Twins 301 /401 were not working correctly for me. I still have them as well.

About 5 years ago a dear friend and HAM Tom WA6UCD in Fountain Valley here locally was very sick and was only given 3 to 6 months to live. Tom had spent his life working in the Boy Scouts and was a Trainer for the Scout leaders here on the West Coast. Now that he was home full time trying to recover from Brain Cancer? I felt he needed a boost so I took him the twins! both sets! I set them up for him and told him he had to work the JOTA in October! Now it is only JUNE so you have time to practice some of your Ham skills again so you will be ready come October! He had a wonderful time and ended up using the equipment the next 3 years!! One of his Son's Mike now has his call sign and I stay in touch with him as well.

Now that I have the equipment back it is in need of repair! Oh well! I am looking for nets, links, or any help that someone could get me for the Kenwood 599 twins. I need the manuals, schematics, parts, etc so I can get this great looking set back on the air. The receiver I already went through and it works to perfection. I am now missing the link cable, and the Transmitter final section is fried and needs to be rebuilt, along with replacing the tuning bands because they are now all broken.

Look me up on QRZ and you can see the radios in the picture before I let Tom use them. They are on the bottom shelf to the left and the Heathkit twins are above them. MY shack has changed just a little since I took that picture!

I also have IRLP node 3551 so dial me up any time.

Any help you could link me up with will be greatly appreciated.
Thank You
Bob Musser

Topic: 23353 Message: 23353

Hello guys and gals,

I have today joined the Group, and hope to be an active and participating member. I have been a 'quiet key' for over 35 years, and now, at 74, I have the time to renew my aquaintance with the airwaves. I am English and an ex Pro musician, as is my American wife. If you would like to know more abaout us, our hobbies and interests, or listen to our music - or that of some of our friends worldwide, please visit my website at www.John4Music.TV

As a pensioner, living on State Benefits (which I paid for by my contributions all my life!), I have little wealth, and have had to start off within financial constraints.

My first purchase, was an 'As New' TS 520SE Transceiver, with fist mic for 130 GB Pounds (200 US Dollars)from a local Amateur Op, and ex-Kenwood Employee.

I paid a bit too much I think on Ebay for my next item, an AT 230 ATU, again 'As New', but with a built in 200W Dummy Load! That cost me the same as the transceiver !!

Arrived today, again an Ebay purchase, an MP-1 Portable Multiband vertical antenna. It was not pictured with its 'extras' - nor were they mentioned, and I was delighted when it arrived from Ireland (Purchased in Germany, made in the US!) absolutely again 'As New', but with the additional extras of the Tripod base, and 80M Coil !!! this all cost me 56 GB Pounds (85 US Dollars).

So !! .... I am all ready (almost!) to get it all set up and on the air, and have just submitted my application (with my certification from 1956), to have a new Licence, but with my old Callsign, a pity I couldn't use two other callsigns (now extinct), that I held in the past, when I was 'Rare DX' - VS9AQP (Aden), and MP4BDS (Bahrein) in the early 1960's.

I hope the forgoing introduction didn't bore anyone, but while I am still here with the Tx key down, could I ask if anyone has a DG 5 Frequency Counter, a VFO 520, or a MC 50 Mic in good condition that they could sell me at a stupidly low price ??? HI

Thanks for allowing me in,

73's and Good DX,

John

From: Greg Anders
Topic: 23353 Message: 23355

Welcome back John,

Your posting is one of the most enjoyable I have seen in a while. That 520SE is a great transceiver even today. I picked up mine earlier this year and recently worked several European stations on 40 meter SSB (now that we can all play on the same frequencies)....

BTW, you would definitely get attention in your area if you signed VS9....

Greg
KG6YV

Subject: [TS-520_820_530_830] 'Hi All' - from a New (Old) Bee !!

Hello guys and gals,

I have today joined the Group, and hope to be an active and participating member. I have been a 'quiet key' for over 35 years, and now, at 74, I have the time to renew my aquaintance with the airwaves. I am English and an ex Pro musician, as is my American wife. If you would like to know more abaout us, our hobbies and interests, or listen to our music - or that of some of our friends worldwide, please visit my website at www.John4Music.TV

As a pensioner, living on State Benefits (which I paid for by my contributions all my life!), I have little wealth, and have had to start off within financial constraints.

My first purchase, was an 'As New' TS 520SE Transceiver, with fist mic for 130 GB Pounds (200 US Dollars)from a local Amateur Op, and ex-Kenwood Employee.

I paid a bit too much I think on Ebay for my next item, an AT 230 ATU, again 'As New', but with a built in 200W Dummy Load! That cost me the same as the transceiver !!

Arrived today, again an Ebay purchase, an MP-1 Portable Multiband vertical antenna. It was not pictured with its 'extras' - nor were they mentioned, and I was delighted when it arrived from Ireland (Purchased in Germany, made in the US!) absolutely again 'As New', but with the additional extras of the Tripod base, and 80M Coil !!! this all cost me 56 GB Pounds (85 US Dollars).

So !! .... I am all ready (almost!) to get it all set up and on the air, and have just submitted my application (with my certification from 1956), to have a new Licence, but with my old Callsign, a pity I couldn't use two other callsigns (now extinct), that I held in the past, when I was 'Rare DX' - VS9AQP (Aden), and MP4BDS (Bahrein) in the early 1960's.

I hope the forgoing introduction didn't bore anyone, but while I am still here with the Tx key down, could I ask if anyone has a DG 5 Frequency Counter, a VFO 520, or a MC 50 Mic in good condition that they could sell me at a stupidly low price ??? HI

Thanks for allowing me in,

73's and Good DX,

John

Greg,

The band is 75 meter's into a known good Dummy load with the load control at about 11:00 oclock. Hope this is what you were wanting to know.

Thanks
Mike

Hi Mike,

Its difficult to tell unless we know whether or not you are running into a dummy load or an antenna? Which band? Where is the loading control set? 270ma would be possible to get 130Watts output but I wouldn't run those tubes at that high an output power for long. As a comparison, I load my 520SE to around 220ma on 75 meters into a dummy load with 100 to 105W output. The plate dip with the loading control counterclockwise goes down to just under 200ma with about 85W output at that level. Then I increase loading slightly to get to 220ma and 100W.

Subject: [TS-520_820_ 530_830] MA Meter on The 520S

Mike w5rkl,

After installing N.O.S tubes in my 520S I let them "Burn In" for afew hours. When I tuned them up for the first time, The nuetralization seemed real closed, but the MA meter is reading 270 instead of the 225 normal reading and the power out is about 130 watts. Isn't that to many Miliamps for the tubes to draw during key down, but what can I do to lower the MA'S.

Thanks
ki0gv
Mike

Hi John and welcome. I'm sure you'll enjoy it here.

I'm English too and retired to Crete, Greece 4 years ago and following a Harec submission I was granted a Greek amateur radio license.

I've operated a TS-520SE from here, it's a great set, easy to use and always gets good reports. I always considered that the DG-5 would just be nice to have but I discovered that you can also use it as a frequency counter on the workbench so it's really a handy piece of kit to have. I've recently aquired a TS-830M which has now taken up the number one spot together with an AT-230. After reading your post I'll have to look at building my dummy load into it.

You might want to check if the HV caps have been changed for new. Until now everyone seems to have been using Panasonic replacements as they are the same diameter and fit the holders. A recent post states that they've been discontinued. They don't cost a lot so it might be worth getting a couple before they've all gone.

Have fun.

My pleasure, Bob... Glad you were able to locate the information you needed...

Bob & I attended high school here in SoCal together, & graduated in 1971... Our paths have crossed often, especially when it comes to radio...

Radio is such a great hobby, & I have so many wonderful friends from it, I wouldn't trade it for a million dollars...

Two million? ... Well... maybe! LOL! :-)

Take care, everyone...

Hi Everyone,
I was working on a sound card interface and had the radio on listening to cw like you do. I must have caught the send switch at some time and before long I got the dreaded smell of something far too hot. The tank coil is U/S but everything else looks ok. Has anyone rewound a tank coil successfully? What gauge is the wire and how many turns are there? How critical is the tank coil construction?

Doh..... I'll leave the heater switch off in future.

You didn't mention what model of hybrid you have. There is a guy (KE5FTF) that advertises parts for the hybrids on QTH.com. I have never done any business with him, just thought he might be a good source of parts. Good luck.

23366. TRIO TS-820D for sale

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-11 17:32:15 UTC
From: jorgensentech
Topic: 23366 Message: 23366

Hello to the group.

I have available a Trio TS-820D. It includes the transceiver and the power cord only. I have uploaded two photos so far of the rig to the Photos section of the group under an album named after my call sign KD6RRR. I originally bought this radio when I was still a no code tech to listen to HF and practice receiving CW. The ham I bought it from was 97 years old and told me it was the best rig he ever owned. However, by the time I reached General and Extra, I had relocated to a new home where I have yet to engineer a stealthy enough antenna to keep the neighbors happy, so I have NOT transmitted with the radio, and cannot verify what he told me. Cosmetically it is used, with scuffs and scratches, but none that affect viewing the controls and settings. All the lamps light up. The 5 toggle switches on the left side of the face are missing 4 of the toggles as the photo I uploaded shows. The switches still function, but now you have to flip them with a fingernail or pen. All knobs and rotary switches work fine. Of the three push on push off button controls, the RF ATT works normal, however the RIT and the DH ones are sticky and must be pulled out after depressing them. The digital display is installed but I assume is disconnected or is not functioning as it has never lit up and I have not had the noise on the receive that some have complained about with this option. I am asking $250 shipped for the rig. Please email or call five four one dash eight eight seven dash zero zero zero five with any questions you may have. Thank you for your time and hope to hear from you soon.

A good operating practice is ALWAYS check the tune up. By doing a full tune up. What would happen if something broke out on the antenna and you did not check the tune?

Hello Bob,

As long as you do not change the settings you will not have to retune the next day or even a month from now.

Hi Friends,
Please BEWARE when dealing with Barry Lenzer WB6LDL.
His MO appears to be that he offers to buy from you and then after a week or two finds a reason to send the item back.
Recently he asked me for a TS-520 to VFO 520 cable. I shipped one out to him without first being paid which I always do because I trust everyone. After 2 weeks, I didn't hear back from him , so I sent a reminder email. His response was: Oh, I used your cable and it worked great but the VFO I bought didn't work so I am going to return your cable and pay for your shipping. Sounded fair, even though he had already used the cable and agreed it worked Great! After about a week, I received the cable but NOTHING to cover my Priority Mail postage or the cost of a bubble mailer. I sent him an email asking about the refund to me on my shipping charges..... Nothing. So after 8 more days, I sent him another email , again asking for the reimbursement. This time he became very nasty to me. Called me Cheap said I was the worse Ham he had ever met in 55 years and that I was harassing him. Said that he already sent me $10.00 and if I lost it, it was MY problem.
Truth be told, there was NO $10.00 sent to me and he seems to do this sort of thing on other deals. Please BEWARE of him!!!
I don't want to say he might be Lying but..... you be the Judge.
Gordon

Yes I googled him and would suggest that you read the experiences of others who have dealt with him BEFORE you do a deal with him .

I don't know the gentleman and had never heard of him , until his call was posted on here and , after reading the many experiences , that are posted , I suggest you take a look also .

23376. FS: My TS-520 Station

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-12 12:56:27 UTC
From: jmcgsd
Topic: 23376 Message: 23376

I have decided to sell my TS-520s station. I am getting into even older stuff (Swan and Drake) and need the room.

The station consists of a TS-520S with 270hz CW filter, an MC-50 microphone and an AT-230 tuner. It works absolutely flawlessly and looks are close to mint. It comes with copies of the manuals for the transceiver and antenna tuners, the service manual for the transceiver on CD, bound copies of many fixes and mods for the 520, and the original Kenwood manual for the MC-50. I am asking $600 plus shipping for everything and would consider an antenna tuner that could handle 600W as partial trade. If you are interested please email me at af6ni at arrl dot net.

Thanks.
Joe

23377. kenwood ts 530sp VFO drift on transmit

How many Hz is a "few hertz". What kind of mode are you experiencing this "few hertz" drift on? I would not think that a "few hertz" drift would be all that much of a problem with a rig of that age. But I may be mistaken.

Please tell us more about how many Hz drift you are experiencing.

You may not have a problem at all

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-12 18:14:43 UTC
From: Greg Anders
Topic: 23377 Message: 23380

Most 530's and 830's drift. Some drift more than others. They all drift more during the first 30 minutes but I have owned 3 830's and 2 530's and all of them drifted some even after warmup. The remote VFO's didn't drift one bit. So, I attributed the drift I saw to the heat inside the cabinet from the driver and finals. A good friend of mine actually studied the drift characteristics of the 830s and found that there were two different tuning caps used in the VFO's, one using phenolic spacers on the rotor plates, the other using a white "plastic". He said that you can "never" stabilize a unit with the phenolic spacers but he was able to stabilize an 830S with the plastic spacers by replacing some of the NPO capacitors with higher compensation parts. However, he spent several weeks calculating the required caps. Currently, there is another Ham in southern Oregon I know who is trying to refit his VFO (white plastic spacers). I will wait to see his results.

FWIW,

Greg

Hi Eric. Are you saying that the frequency drops "a few hertz" in transmit, and then goes back to the original frequency on receive? How do you know this, as the Digital display on the TS-530SP only reads in 10 hertz steps?

My TS-530S drifts about 100 HZ per half hour, which is what is specified in the manual after warmup. You can measure the amount of drift that you have in the following manner:

If you are set up for PSK or other digital mode operation. connect your interface. If not, you can connect a cable from the headphone jack on the radio to the line in on your computer sound card, or even just place mic connected to the computer sound card near the radio speaker.

Tune the radio to WWV, and start your PSK software. I use Digipan. Tune the VFO so that you see the WWV carrier on the waterfall display. Click on the center of the carrier., and write down the time and the audio frequency shown in the program. Check again at 15 minute intervals, and write down the time and audio frequency. The difference in the audio frequency is the amount of drift. After about 20 minutes or so, the drift should be minimal(50Hz or less in any 15 minute period after warm-up)

Since WWV is a frequency standard, what you are seeing is the VFO drift (and and drift in the sound card)

Id be interested in seeing what those spacers would do for my rig.
I had noticed that the mode switch was dirty and i gave it a spritz with some cleaner and now the rig seems to be more stable.
It seems like it desont drift quite a much now.,
Im thinking that maybe the rig might need a tuneup. the p[revious owner said he had it retuned back in the late 1980s so id say its time for a tuneup.

Hmm i got a AM filter from him for a FT 101EE once and he asked me if i was a CB op. I replied that i was a general class ham and i was going to use it for AM operation on 160 and 75 meters. He then asked me if i was a 13 or a 5 WPM General and i replied what difference does it make and his reply was "It makes a HUGE difference!" I take it he has a major attitide problem just from the wording in his Ebay descriptions and the emails i have gotten from the guy.

The only meter function in receive is the displaying of incoming signal strength in S units. The other meter functions, ALC, HV, IP, RF, and COMP, display ONLY in transmit, not receive.

23388. TS520S TUN position not working

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-13 00:08:26 UTC
From: jaiden0
Topic: 23388 Message: 23388

Greetings all. I am a new ham and even newer to HF, and my HF rig is an inherited TS-520S that sat on a shelf for 25 years or so. It does seem to *mostly* work, but I have had some trouble with it. For this post, I'll focus on one issue that is clearly definable and easy to reproduce.

The TUN position of my TS-520S doesn't seem to work. The frequency displayed on the DG-5 is fixed for each band, and the VFO does nothing. The frequencies displayed for each band are:

1.8 -- 0.694.8
3.5 -- 2.396.5
7 -- 5.895.1
14 -- 12.895.2
21 -- 19.895.3
28 -- 26.894.8
28.5 -- 27.395.5
29.1 -- 27.995.3

Clearly something is wrong with the TUN position, since the other positions seem to work OK. I have made contacts on 20 and 40 meters, though I still have a LOT to learn about this old radio. I am not afraid of a soldering iron, but I'm not going to go poking around unless I know what I'm looking for.

Thanks in advance for any advice you can give.

From: gyancey52
Topic: 23395 Message: 23395

I got the hang of how to tune my rig I just have a few questions to help tweek it just right. When properly tuned the insturctions say you should end up with 100 watts more or less. If you want less than 100 watts for one reason or another do you adjust the load or drive control or neither. I was told by the guy I bought it from to just turn the mic gain down, but that doesn't make sense to me, seems that would only screw up your audio and sound like garbage.
Also when changeing frequencies do you start all over again from the beginning adjusting load, plate current, re-dipping, etc or is there a short cut after getting the initial settings.
When adjusting the mic gain can you do that with the dummy load or do you need to be on air.
Sorry for all the questions, I just want to make sure I'm doing it right. The radio is puring like a kitten, just want to keep it happy.

That should have been "as long as you don't change frequencies too far.....you will not have to retune..."
If you don't change the VFO more than a hundred kHz, or change bands , no retuning, of plate, load or driver capacitors....

23398. 520 Parts Needed

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-13 05:30:19 UTC
From: jsloss
Topic: 23398 Message: 23398

Need the 1st and 2nd bandswitch wafers when counting from the rear to the front. Whole BS from a parts unit would also work.

Service Hint: Don't ever forget to connect the RF output connector to your dummy load when servicing the transmitter. It does not take much 14 Mc energy to arc over a switch contact! This simple oversight instantly created several hours of unnecessary additional restoration work.

Joe k7mks

23399. Plate Choke details for TS-830

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-13 06:29:25 UTC
From: sv0xbq
Topic: 23399 Message: 23399

Hi Folks,

Can anyone confirm the plate choke construction for a TS-830 before I order the wire.

I make it 200 turns of 36 SWG. Is this correct?

Chris

That is what the statement:

"As long as you do not change the settings.."

meant which includes the VFO.

23402. Great diagnistic skills

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-13 03:19:12 UTC
From: kevin
Topic: 23402 Message: 23402

I bought a 530 from E-Bay recently. I thought it might be a nice upgrade from my 520. Receive worked well and I liked the digital display. But I couldn't get it to tune up. No drive no nothing. Like a good member I spent several hours combing the messages to see if I could find any insight. Try searching for "drive" in the messages sometime. Finally I figured I'd better open it up and see if anything was obvious. That much I also learned here.
I did open it up and thanks to my great diagnostic skill found the problem right away - No tubes. I have been laughing at myself all evening. Check the simple and the obvious is the lesson to be learned here.

Hello again Happy Campers!

Firstly, thanks to those who were kind enough to respond to my first post, introducing myself, which I thought was a common courtesy when joining a Group ! We Brits are a bit of a 'stuffy' lot when it comes to manners and etiquette ! HI !

While I am awaiting the re-issue of my licence, I have been doing a bit of work on my web site, which covers not only my Amateur Radio Hobby, but also my Dogs, Camping, and my somewhat dubious Musical talents.

I only decided on a mad impulse about 10 days ago, to take up Amateur Radio again, after being 'quiet' for over 40 years, and I am doing a 'sort of'' Blog, which could make interesting reading for those members of this Group, who have time to waste reading codswallop rather than morse !!!

My Amateur Radio Page can be found at :-
http://www.john4music.tv/7.html <http://www.john4music.tv/7.html>

I hope it is interesting to people other than myself! HI

73 de John

'Support the Arts - Feed A Musician !'

I was born with nothing..... 74 years later, I still have most of it left !

I am a 'Licenced Radio Amateur' ... NOT a 'Radio Ham'

Hi
I've noticed the HT on Tx has dropped to about 400V, off load its just under 800V.
Diodes D1 to D4 look OK I'm suspecting the two electrolytic Caps C22 & C24.

However between the 400V and 800 point on the rectifier unit there is only about 65V.
To me this is wired as a voltage doubler,, yet the transformer is marked as 0, 400, 800 , in the service manual. That looks wrong into a voltage doubler, 1600V on a 6146 would give a lot more power, but not for long.

Could someone please let me know what the secondary voltages are in real life, on and off load. Measured at AC800, AC400,GND. and across the secondary windings as well please.

Its not dry joints as I've already dealt with those on the rectifier unit.

23406. Re: Tuning TS 830S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-13 19:17:43 UTC
From: nospamvictim
Topic: 23395 Message: 23406

The answer is neither.

Any mistuning of the PLATE, LOAD or DRIVE WILL RESULT IN GARBAGE AND HARMONICS and risk damage to the tubes. Note that these controls are for TUNING the stages.

To reduce the drive LEVEL and so the power on CW, reduce the CARRIER and for SSB, reduce the MIC gain, but DO NOT MISTUNE DRIVER AND FINAL stages. If you want ALC action to reduce the power then introduce ALC voltage (9v battery and pot?) to the ALC line to cut the power back, and set mic or carrier accordingly for proper ALC indication. This is of some value for SSB, but not recommended for digital operations. If you want to cut the power down for a transverter or AMP, use an external attenuator for more than a 1/3rd reduction.

Fully loaded, mine shows ~120 watts CW with about 240 mils IP. Always tune up for maximum output. Plate current dip should be very shallow and coincide closely with maximum output or you need to neutralize.

--- In TS-520_820_530_830@yahoogroups.com, "gyancey52" <gyancey52@...> wrote:
>
> I got the hang of how to tune my rig I just have a few questions to help tweek it just right. When properly tuned the insturctions say you should end up with 100 watts more or less. If you want less than 100 watts for one reason or another do you adjust the load or drive control or neither. I was told by the guy I bought it from to just turn the mic gain down, but that doesn't make sense to me, seems that would only screw up your audio and sound like garbage.
> Also when changeing frequencies do you start all over again from the beginning adjusting load, plate current, re-dipping, etc or is there a short cut after getting the initial settings.
> When adjusting the mic gain can you do that with the dummy load or do you need to be on air.
> Sorry for all the questions, I just want to make sure I'm doing it right. The radio is puring like a kitten, just want to keep it happy.

If I understand your situation correctly, you are seeing 800V no-load and only 400V full load.
If this is true you have a problem. No load should be 800-850V and at ~100watts output you should see 750V or better.

Sounds like filter caps or rectifier diodes are bad to me. I would just replace both caps and all the diodes...

Hi. Some early FT-101radios came with an 11M position on the band switch. Later units did not. I had two that did not, but I have seen a couple of FT-101Bs that did. I would say that asking if you were going to use the radio for CB is a legitimate question. The FT-101 radios are still very popular with CBers, because they are easy to modify, and have AM mode built in.

His other question however was both irrelevant and insulting. He is obviously one of those "sour grapes" guys that thinks that "I had to take the higher speed code tests, so everyone else should too". About all you can do is ignore the few that have that kind of attitude. It actually makes no difference to most Hams (and of course no difference to the FCC) when you got your license, or what (if any) code test that you took.

It is possible to modify a Kenwood TS-520 to operate in AM mode. I used to have one that was so modified...I never did figure out how to undo that, though I replaced the CB crystals and re-aligned the radio. I believe that Kenwood decided not to include AM mode in the TS-5XX and TS-8XX series radios so that they would be less attractive to CBers looking to illegally modify an Amateur Radio for CB use.

Hi John. Nice web site! One thing I see that you have not mentioned
is whether or not you have a dummy load. You will need one. They can
be found numerous places online, or you can build your own. I
recently built one for a friend which is very similar to the one shown
on Ken's (K4EAA) web site at http://k4eaa.com/dummy.html

The one I built has a few minor but un-importamt differences. It
works very well! I have written up how I built the dummy load, and
sooner or later will get around to making a page on my web site for
it. My web site is at
http://home.mchsi.com/~kb0hae/index.htm
On the site you can see a photo of my current "shack" setup.

Gordon is right-on. The stator plates have HV on them and the rotor is grounded. If plates from one touch the other you have a HV short to ground, "el-blowish-fuses".

23415. Kenwood Twins 599 Help

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-13 22:59:24 UTC
From: Bob
Topic: 23415 Message: 23415

I just uploaded a few pictures of my KENWOOD 599 Twins and I am in need of a little help. I loaned this set out for about 3 years to a local Ham here in O. C. that was diagnosed with a brain tumor and lung cancer close to 4 years ago. He spent most of his spare time working for the advancement of adult education for the Boy Scouts of America in the Orange County area. When he was diagnosed he was given just a few months to 6 months to live. So because it was coming up on the October JOTA and he was a Ham I loaned him the rigs so at least he could be on the air. He ended up using the rigs for 3 years. He lived to see another grandson born and 3 more trips to Hawaii for vacations with his wife who is also a Ham. After his passing his son picked up his call.

So now I would like to get the rig working again. I have gone through the Receiver and it is working fantastic after very little work. A good dusting and lube job. IT is very clean.

The T 599 well that is another story. Because the rig was working when I got it I never really pulled it all apart so I am a little surprised to find a mess. Or from a different point of view such a great project! Now that I am unemployed I have the time to pull things apart the equipment and work on them. So..

The RF section of the transmitter is fried. I have posted a couple of pictures so you can see what I am looking at.
1st picture is under the two 2001's the resistors are cracked do to stress, heat, high voltage?.
2nd the transformer may have been repaired or modified because the tape has come apart from where someone cut wires and then re-attached.
3rd the rubber bands for the rollers have dried and cracked and fallen off.
Note: this could have been the cause the final section fried because the bands broke and it could not be tuned?
4th is the coil between a 2001 and a 6146B looks like it caught on fire.It has two different tubes in it? Don't they have to be matched?
5th is of a diode that has been replace on the board next to the transformer. This diode looks out of place and the solder indicates that it was a repair at one time.

I was told that the radio blew the fuse. The fuse was replaced and then it would not transmit.
It looks like someone tried to repair it and failed. Or it was repaired and they did not do a great job but it was working?

My goal is to get the Transmitter working and looking as good as the Receiver and put it on the desk above my TS 820 so I can use them both.
Any suggestions as to where to start?
Bob

Gee, Bob, I am so sorry to hear that a great radio like the T-599 got trashed like that. You have to wonder if it stayed with your "friend" all that time, or not.

But to the repair. Do you have a complete schematic of the rig? If not, you certainly should get one.

First thing I would do would be to replace all the damaged or destroyed parts with new devices. I would also pull the tubes, and replace them with matched ones.

If the transformer checks out OK, you can replace the wires with the same gauge wire, but use heat shrink tubing on the splices. Be sure to use the old "western union" style splice, where the wire is twisted axially around the leads instead of sticking out at a 90 degree angle.

It is very possible that the drive bands had dried, and someone who didn't know about "peak and dip" just tried to transmit with it, anyhow.

Have you checked the band crystals? Are they the right ones, or are there some 11 meter crystals in there in place of the proper ones? That might also have contributed to the carnage inside the rig.

Doing the proper repair/restore job on that rig will take some effort, but it will be worth it !

Good luck, and keep in touch with the group, I know there are some real experts here that will be able to give you some good hints.

73, Jim AG3Y

Subject: [TS-520_820_530_830] Kenwood Twins 599 Help

I just uploaded a few pictures of my KENWOOD 599 Twins and I am in need of a little help. I loaned this set out for about 3 years to a local Ham here in O. C. that was diagnosed with a brain tumor and lung cancer close to 4 years ago. He spent most of his spare time working for the advancement of adult education for the Boy Scouts of America in the Orange County area. When he was diagnosed he was given just a few months to 6 months to live. So because it was coming up on the October JOTA and he was a Ham I loaned him the rigs so at least he could be on the air. He ended up using the rigs for 3 years. He lived to see another grandson born and 3 more trips to Hawaii for vacations with his wife who is also a Ham. After his passing his son picked up his call.

So now I would like to get the rig working again. I have gone through the Receiver and it is working fantastic after very little work. A good dusting and lube job. IT is very clean.

The T 599 well that is another story. Because the rig was working when I got it I never really pulled it all apart so I am a little surprised to find a mess. Or from a different point of view such a great project! Now that I am unemployed I have the time to pull things apart the equipment and work on them. So..

The RF section of the transmitter is fried. I have posted a couple of pictures so you can see what I am looking at.
1st picture is under the two 2001's the resistors are cracked do to stress, heat, high voltage?.
2nd the transformer may have been repaired or modified because the tape has come apart from where someone cut wires and then re-attached.
3rd the rubber bands for the rollers have dried and cracked and fallen off.
Note: this could have been the cause the final section fried because the bands broke and it could not be tuned?
4th is the coil between a 2001 and a 6146B looks like it caught on fire.It has two different tubes in it? Don't they have to be matched?
5th is of a diode that has been replace on the board next to the transformer. This diode looks out of place and the solder indicates that it was a repair at one time.

I was told that the radio blew the fuse. The fuse was replaced and then it would not transmit.
It looks like someone tried to repair it and failed. Or it was repaired and they did not do a great job but it was working?

My goal is to get the Transmitter working and looking as good as the Receiver and put it on the desk above my TS 820 so I can use them both.
Any suggestions as to where to start?
Bob

23421. Kenwood Twins 599 Help☐

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-14 00:37:24 UTC
From: Bob
Topic: 23421 Message: 23421

The Service Manual that I do have is one that I downloaded from the group. It is the Model T-599S... I am not sure if there were to many changes between the two rigs. My 599 is the first one made with out the Mic gain and Car Level on the front panel. Other than that I think it is the same. Inside the Service Manual there is a Schematic Diagram that I think will be OK.

The radio did stay with him for the time I loaned it. Not an Issue and I purchased it from the original owner in working condition and used it before I picked up my 820 I just never had cause to open it up after putting it on the air so many years ago. So I never pulled the bottom plate to see if it had been worked on.

There are no 11 meter crystals installed.

Parts?? Kenwood is here in So Cal should I just get the parts from them or is there a better place? Orvac? Ford Electronics in Fullerton? I know Bob Ford has passed but his sons run it and they are Hams? If there is a place I can get the parts handed to me instead of via Internet ordering that is what I would prefer then I can see and touch it when I pay for it.

Is there a kit or does someone have a list of parts to replace the rubber band style tuning apparatus and replace them with a chain driven style? Now that I will have the transmitter torn apart it would be a great time to upgrade it so I don't have to worry about cracked and worn out rubber bands. That way my son who is only 21 and a Ham can use it for the next 35 years.

I tested the tubes with a 35 year old tester that I have and all 3 are OK. No shorts etc. So how important is it for the tubes to be the same, or can the 2001 be used with the 6146B?

If I am reading the Schematic correctly the coil L3 is the vertical long coil on the top of the case between the two finals. It looks like it had caught on fire. Yes it is melted! From the top of L3 there are two coils L 12 and L 13 that go to the tops of the tubes.

Is there a better Schematic out there? How about the old Sams books? Those made this type of work so much easier.
Bob

> To reduce the drive LEVEL and so the power on CW, reduce the CARRIER and for SSB, reduce the MIC gain, but DO NOT MISTUNE DRIVER AND FINAL stages. If you want ALC action to reduce the power then introduce ALC voltage (9v battery and pot?) to the ALC line to cut the power back, and set mic or carrier accordingly for proper ALC indication. This is of some value for SSB, but not recommended for digital operations. If you want to cut the power down for a transverter or AMP, use an external attenuator for more than a 1/3rd reduction.

Hello friends. I own a Kenwood TS 830s,a Heathkit SB200 amplifier, and MFJ 962D antenna tuner,an MFJ memory driven keyer,and MFJ paddler keyer and an MFJ 962 code decoder. Can anybody tell me (in detail) how all this hooks up and what RG8X jumpers go where? Example: From radio transceiver where does the jumper go? From amplifier rf out where does jumper go, from amplifier rf in where does jumper go? Below is a clickable link to view the back of the MFJ 962B antenna tuner. I am using a G5RV antenna than can handle the power of the amplifier. The antenna has a pl-259 connector on the end.

http://www.rimtai.com/chtr/products/MFJ/images/MFJ-962D-1.jpg

Also, can somebody tell me in detail how to tune up the amplifier with the MFJ 962B roller inductor antenna tuner? I know how to tune up on the radio without the amplifier on a non roller inductor antenna tuner MFJ 969. I have this all this nice equipment but do not know how to hook it all up since I am brand new to HF radio. Any help will be appreciated. 73's Jonathan KD4MPW

Johnathon, you'll need a short coax with an RCA plug or adapter from the output of the 830 to the RF In jack on the SB 200. Then, from the SB200 RF Out, connect a short piece of coax to the input of your tuner, then the output of the tuner to the antenna.

You will need to hook up the keying output of your 830 to the ANT Relay jack. (Note: I use an outboard solid state relay in this line between the 830 keying output and the Relay Jack because of the high bias voltage being switched. This will protect the relay in the 830 from abuse or failure.) I do not use the ALC circuit from the Amp to the 830.

Before you turn on the amp, you will need to tune the antenna using your tuner. After this is done then you can tune up the amp. (I'm assuming that you have manuals?) If not, you probably should not proceed until you have them for reference. For instance, wiring the din plug to the 830, for switching, you will need the diagram. Also, it is important to follow the tune up procedure outlined in the manual for the SB200.

Also, you may need to isolate the keyer output from the keying circuit of the 830 to make it key properly, again you are switching a higher voltage than most of the newer solid state keyers can handle. And, sometimes the polarity is incompatible with the keyor output. I use a "Key-All" from Jackson Harbor.

Don't know how to hook up the decoder.

Oh, to use the tuner, you can peak the noise on your receiver by turning the inductor first, then do the same with the capacitors. This will put you in the neighborhood before you apply power. Use lower power, like in the tune position of the 830 and quickly adjust the roller inductor followed by the caps. Once you find the correct settings, write them down for future reference. (Note: these settings will change if you change your jumper lengths, take the amp out of the line up, etc. but they will be good for next time if you leave the hook-up configuration alone. I would get familiar with how it tunes before using the amp.

Johnathon, you'll need a short coax with an RCA plug or adapter from the
output of the 830 to the RF In jack on the SB 200. Then, from the SB200
RF Out, connect a short piece of coax to the input of your tuner, then
the output of the tuner to the antenna.

You will need to hook up the keying output of your 830 to the ANT Relay
jack. (Note: I use an outboard solid state relay in this line between
the 830 keying output and the Relay Jack because of the high bias
voltage being switched. This will protect the relay in the 830 from
abuse or failure.) I do not use the ALC circuit from the Amp to the 830.

Before you turn on the amp, you will need to tune the antenna using your
tuner. After this is done then you can tune up the amp. (I'm assuming

that you have manuals?) If not, you probably should not proceed until you have them for reference. For instance, wiring the din plug to the 830, for switching, you will need the diagram. Also, it is important to follow the tune up procedure outlined in the manual for the SB200.

Well I cleaned up a very nice 530 on the bench. Put it back together and did something so stupid it was hard for me to believe. Long story short while in the tune position and connected to a dummy load. I left it in the send position for quite a while. I had tripped the switch moving it around. Totally stupid. Came back to that awful smell of burned "stuff". Blew the 3 amp fuse in my isolation transformer and of course it will not tune up. Receive is fine. I am hoping against hope that all I did was fry the resistors at the finals.

Doesn't end there. To nurse my wounds I tuned up my 520 to play tonight. Tuned up great but when I tried to use it - zippo. Tuned it three more times same thing. Then I realized that the seeming problem is that when I switch from CW while tuning to USB or LSB I lost my "juice" Any ideas?

I have a rope around my neck but haven't kicked the ladder out yet. Tomorrow should be a better day.

Hi Martin

Thanks for taking the time to look at what I am doing on my web site.

The Amateur Radio Pages, I hope, will over the coming months, be a 'blog' as to how I set up a new station from 'scratch', and the joys and sorrows, entailed !!

Re needing a dummy load! I bought a Kenwood 230ATU off Ebay - paid too much for it at 200 dollars (in your money!), but it was 'mint' (as new), and had the luxury of having had a dummy load built in !!

If you look at the 230ATU Manual (there is a copy in the 'files' section here), it describes the making of a suitable dummy load, and on looking inside, I see that this is exaxtly how it was done. The Resistors are all 'Morganite' (Google for more info - but they are quite special!).

When I finish my posts here, I will go and have a 'nosey' around your web site.

Kindest regards and 73's

John

www.John4Music.TV <http://www.John4Music.TV>

Support the Arts - Feed A Musician !

I was born with Nothing ..... 74 years later, I still have most of it left !!

I an not a 'HAM' ! ..... I am a 'Licenced Radio Amateur'

.

Have looked over the other post and their steering you in the right direction. I would recommend strongly that you only set up the radio, tuner and antenna at this point to become familiar with how the radio and tuner works. Read the manuals for tuning instructions and follow them. Until you are comfortable with using the radio and tuner, the amp can safely sit on the side unharmed. Place them where you want them so it all looks good, but let the amp be a decoration till you are familiar with how things work. There is not a dummy load on your list. You will need one for tuning the radio and also the amp. You will need one that can handle the full output of the amplifier. Without a dummy load, you can't safely tune the radio or the amplifier.

Hi Kevin,
I did a similar thing earlier this week when I accidentally flicked on the send switch. The smell of smoke was the first thing I knew of it and by then it was too late. The plate choke burned out as did the cathode resistors. I've rewound the choke and I'm replacing the resistors this afternoon. I can only get 22 ohm resistors here giving me 5.5 ohms total but I'll fit them and see how it goes.

Hi Dennis and thanks for the post.

Yes the regulator is inside the box on mine, I'd heard of others moving theirs outside as you describe but didn't know that Swan actually manufactured them like that on later units.

It's one of those things I'll get around to doing one fine day :-)

Thanks again Dennis,

Also, you may need to isolate the keyer output from the keying circuit of the 830 to make it key properly, again you are switching a higher voltage than most of the newer solid state keyers can handle. And, sometimes the polarity is incompatible with the keyor output. I use a "Key-All" from Jackson Harbor.

Don't know how to hook up the decoder.

Oh, to use the tuner, you can peak the noise on your receiver by turning the inductor first, then do the same with the capacitors. This will put you in the neighborhood before you apply power. Use lower power, like in the tune position of the 830 and quickly adjust the roller inductor

followed by the caps. Once you find the correct settings, write them down for future reference. (Note: these settings will change if you change your jumper lengths, take the amp out of the line up, etc. but they will be good for next time if you leave the hook-up configuration alone. I would get familiar with how it tunes before using the amp.

Hi John,

Nice site - I'm surprised that you've got time to do radio as well as all your other hobbies :) Like you I am also a muso (I play guitar and mandolins and stuff like that) and I find that I naturally have a fairly good ear for signals in the depths of it all (probably something to do with loud rock music and listening for cues from drummers who are being drowned out by noisy bass players!!)

Like you said, us Brits are a bit stuffy at times but we are also pack animals so on the back of your intro, I thought I'd better introduce myself.

My name is Rob and I got really stuck into radio in the last year or two after a lifetime's interest. I obtained my Advanced licence earlier this year with my radio club (Ripon and District ARS) and I've been loving it ever since.

I've got a website http://www.m0rby.co.uk where I hope to add more as I go along.

My interests are mainly digimodes, SSTV and homebrewing/experimenting for which I use my TS-820S.

I'd be interested to hear if anyone else uses the TS-820 or similar for PSK and how you are doing it and how you set the rig up. I've made contacts all over the world, mainly on 20m, using PSK with that great sense of achievement when you get a new country on the other side of the planet - my biggest grin came when I contacted Sydney, Australia.

Anyway, enough of this. Hello again and I look forward to many more interesting posts here about these fabulous, long-suffering, bombproof rigs :)

Regards

Rob M0RBY

I can't answer your first question, but I might be able to help with the second. I know that on my TS-520SE the VFO knob seemed to have some wiggle in it. When I had the faceplate off to check a bunch of other things out I noticed that the shaft assembly was loose in it's mount. looking it over I noticed that it had been locked in place with some type of compound. It's a bit hard to explain, someone else might be able to do a better job.

In any case, I mixed up some 5 minute epoxy and used that to lock the shaft assembly back in place with the mounting plate. That fixed it up very nicely and now it is nice and solid again. I don't know if the 830 is going to be similar, but it is worth checking out. No matter what I think you have to take off the faceplate, so have fun with that!

Hi Kevin,

From your post, and the responses so far, I have found Ebay much different here in UK, to the 'US Experience'..

I have bought my and sold my last 3 cars (all unseen) - A Volvo Station Wagon, Mazda 323, and lastly my Renault Megane 'Scenic' MPV Diesel (it cost me 500 dollars in US money!) that I have now driven for the last 18 months.

I have also, as a Musician, bought and sold Organs and Keyboards, and this last week or so, bought Amateur Radio Equipment - a Kenwood TS 530, 230 ATU, MC 50, and MP-1 Antenna. (Described and pictured on my web site at www.John4Music.TV <http://www.John4Music.TV> Under the 'Amateur Radio' Button.).

Everything I have ever bought has been 'As Described' - I have met some great people, and have never had a bad deal (I am up to over 200 !).

In this country, you can drive to collect, or deliver in most Cities. I am smack bang in the middle of UK, and there is not much that is farther than 200 miles away! If I go due East - the North Sea is about 100 miles, If I go due West, I can bathe in the Irish Sea in North Wales 65 Miles away !! Birmingham (our second biggest City), is 40 Miles South, London 150 Miles South. South Coast about 220 miles!. Liverpool is about 90 Miles North West, and Glasgow (Scotland), is about 250 miles North !!

Although I lived and worked in the US for ten years (and stole one of your beautiful ladies!), I still find UK quite a big place !!

What I am trying to say, is that if someone did 'Rob' you on Ebay in UK, it isn't far to go with the old Fox .410 to give them both barrels, so perhaps we HAVE to play fair!

Some great responses to your post.

Kind regards & 73's

John

I too couldn't believe what I'd done. I shut everything down and grabbed a bottle of wine, leaving everything for the next day. You cant mistake the toasted choke. It should look bright and shiney. Mine did look like toast and was open cct. The resistors had turned to dust but the cct board was ok. The 6.8 micro henry choke that's wired to the base of the plate choke is also looking cooked although it's not open circuit so I'll change that as well. It's all easy to get to and the plate choke is easy to rewind. I've set up my TS-520SE in the meantime until it's all sorted. The States were getting to Crete easily this evening on 20m before dusk.

Check out Ken's webpage on the Kenwoods. http://www.k4eaa.com/ for alot of info.
Look over the Tuning info. Most people follow it pretty easy.
http://www.k4eaa.com/tune-up.htm and see if that helps.

All of the manuals have been read and re-read. I just need it broken down a little. I have never done this so it is new to me and appears to be pretty touchy as well.

. You can measure the amount of
drift that you have in the following manner:

If you are set up for PSK or other digital mode operation.Tune the radio to WWV, and start your PSK software. I use Digipan.
Tune the VFO so that you see the WWV carrier on the waterfall display.
Click on the center of the carrier., and write down the time and the
audio frequency shown in the programt
_ is_drm"

I think i found some of the problem. The mode switch is causing the rig to drift somewhat. If i switch to tune to cw and to lsb it will stop drifting. Last night, when i was on 10, it never drifted once.

Don't feel too bad.... I did something similar yesterday. In my newly acquired TS520S a previous owner had replaced the two 1-watt-10-ohm-5% resistors at the finals with 5-watt carbon units. Based on advice seen here, I decided to replace them with 1-watt units so they would be protective as Kenwood intended..... but instead of carbon types I used metal oxide film types. Seemed to be OK, so on to the real problem: good drive on 80M through 20M, but very low drive on 15M and none at all on 10M. Decided to replace the driver 12BY7A but problem still there, so I replaced the 6146W finals with two brand new JAN 6146Ws. I then tried checking the drive but as soon as I threw the SEND switch there was an arc..... the two 10 ohm metal oxide film resistors were fried. Aside from the possibility that metal oxide film resistors are not correct in that application, I'm not sure what I did wrong.... or what to do next. (Any advice appreciated)

Well I cleaned up a very nice 530 on the bench. Put it back together and did something so stupid it was hard for me to believe. Long story short while in the tune position and connected to a dummy load. I left it in the send position for quite a while. I had tripped the switch moving it around. Totally stupid. Came back to that awful smell of burned "stuff". Blew the 3 amp fuse in my isolation transformer and of course it will not tune up. Receive is fine. I am hoping against hope that all I did was fry the resistors at the finals.

Doesn't end there. To nurse my wounds I tuned up my 520 to play tonight. Tuned up great but when I tried to use it - zippo. Tuned it three more times same thing. Then I realized that the seeming problem is that when I switch from CW while tuning to USB or LSB I lost my "juice" Any ideas?

I have a rope around my neck but haven't kicked the ladder out yet. Tomorrow should be a better day.

Hi John. All of the PSK programs that I have used display the RX audio frequency in some fashion. I use Digipan because it is easy to set up and use, and it runs well on the ancient laptop (P166, 48 meg ram, 6 gig HD) that I use for digital modes. I have tried some other programs, but I like Digipan the best.

Hi Jerry. The metal film resisters should be just fine. Sounds like
possibly a short in one of the new 6146Ws. The low drive problem
might mean that the radio needs to be aligned.

I would first check the rig very carefully for any other parts that
look like they might be burnt etc... Then put the old 6146s back in,
replace the resisters again, and see what happens. The manual has
instructions for the basic alignment of the radio. If you attempt the
alignment, make sure to use the appropriate plastic tuning tool(s),
and do not force any coil slugs that seem stiff or stuck!

I suggest that you look at Kens (K4EAA) web site at
http://www.k4eaa.com/index.html
Lots of good info there, and he sells appropriate tuning tools as well
as other useful parts, including kits of resisters.

TTYL and good luck!

Jerry,
sounds like one of your new 6146W tubes arced or what we call " Had a
Glitch"
I have used MOF resistors without any issues.
Put your old 6146 finals back in and check the band switch but also
check ALL the solder joints under the RF board and all the Connectors
for bad contacts on the RF board.
Of course, you will need to replace those resistors first.

23455. TS-520SE - question about receiver calibration

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-14 23:41:00 UTC
From: Peter
Topic: 23455 Message: 23455

I recently acquired a TS-520SE and I want to do the calibration as described in section 6.3 - ?? of the owners manual. The first part is very clear and the steps are easy to follow. however, when I get to WWV adjustment I'm thrown off by references to T4 & T5. of course the warning "Do not attempt to tune coils T1 and T2" doesn't instill confidence. are these the same T1, Etc. that are in the service manual? If so, can the instructions in the user manual be followed instead of the service manual?

23456. 530 damage

Dr OM Kevin: First of all the 530 lives on 6 amp fuses. And don't start this whiny thing here. I need a new knee, my wife has breat cancer and it is serious. Winter is about to set in here in SE Michigan and my F-150 has 200 K on it. In other words, your story is lame and you should be thankful for your minimum losses and thank God you can at least get around without pain. . Keep on sending CQ on 30 meters and hope the African station hears you. Vy 73 Rich K8UV

I think Ken lists a "service pack" or something similar to that of 6 amp fuses .

Does arcing like that ruin the tube? Or does it indicate a faulty tube to begin with? Is there any way to tell which of the two tubes arced? I just bought them, so I amy be able to arrange an exchange if I can identify the bad one.

Thanks for the advice.... 73, Jerry K3BZ

Jerry,
sounds like one of your new 6146W tubes arced or what we call " Had a
Glitch"
I have used MOF resistors without any issues.
Put your old 6146 finals back in and check the band switch but also
check ALL the solder joints under the RF board and all the Connectors
for bad contacts on the RF board.
Of course, you will need to replace those resistors first.

Hi, Martin... first thing I did to it was alignment as described in the Manual, using the correct tools. I have the 3 from Ken. All the slugs moved properly with correct results. It was a bit out on several adjustments, but when alignment was done it still had low drive on 15 and none on 10. Same after trying 5 new 12BY7s. I will replace the resistors and try again with original 6146Ws as you suggest, but I don't expect any different result as bottom line is I won't have changed anything from last try before the new tube arced. I guess I'll have to get another final and try that again?

Hi Jerry. The metal film resisters should be just fine. Sounds like
possibly a short in one of the new 6146Ws. The low drive problem
might mean that the radio needs to be aligned.

I would first check the rig very carefully for any other parts that
look like they might be burnt etc... Then put the old 6146s back in,
replace the resisters again, and see what happens. The manual has
instructions for the basic alignment of the radio. If you attempt the
alignment, make sure to use the appropriate plastic tuning tool(s),
and do not force any coil slugs that seem stiff or stuck!

I suggest that you look at Kens (K4EAA) web site at
http://www.k4eaa.com/index.html
Lots of good info there, and he sells appropriate tuning tools as well
as other useful parts, including kits of resisters.

TTYL and good luck!

Hi Jerry. I wouldn't expect any difference, just for the radio to (hopefully) still work as before. Replacing the finals will not help the low drive problem. My TS-530S does have less drive on 15M, 12m, and 10M. I have to turn up the Car control more than on the other bands. This is with a new 12by7a.

A shorted tube is just plane bad. I would return both tubes. Sometimes they can become shorted from rough handling during shipping. The best was to test tubes is with a tube tester. You can use an ohm meter. The only two pins that should get a low resistance reading are the pins that connect to the heater.

Hi Jerry,
YES, Tube has an internal short. No longer usable in my experience.
Only way I know of to find the shorted tubes is swap them with another known good tube one at a time.
You will quickly find the bad one but might have to replace resistors again :)
I would send them back for another pair. They usually will not show a short on a tube tester. They usually only short when they are trying to actually work instead of Idle .
Your Low ALC can be caused by Dirty Band switch contacts for 15 and 10 meters, and/or perhaps some resistors going high in value in that circuit.
While you have the Finals board out to replace the blown resistors be sure to Check all the other resistors in there too with a meter. Looks can be deceiving. I have seen many resistors that physically looked perfect, but were bad when placed across my ohm meter. Take Nothing for granted hi hi..

I need a mic for the TS-830S
I've been looking at the internet with very conflicting information about the mc-50, mc-60, and mc-60A
Is the mc-60 amplified or not? I know the mc-50 is not amplified. I know the mc-60A is amplified. What's the difference between the mc-60 and mc-60A? Also read about RFI with the mc-60
I read that the 830S rig should not use the amplified mic.
The mc-60 looks a lot nicer than the mc-50, and the amp could be disabled on the mc-60.
so that brings me back to trying to select between the mc-60 versus mc-60A. Is the RFI a big problem? I see there a lot of fixes for it.
hope someone can sort this out for me and help me select a mic.
thanks, Fred

Subject: [TS-520_820_ 530_830] best mic for the TS-830S ?

I need a mic for the TS-830S
I've been looking at the internet with very conflicting information about the mc-50, mc-60, and mc-60A
Is the mc-60 amplified or not? I know the mc-50 is not amplified. I know the mc-60A is amplified. What's the difference between the mc-60 and mc-60A? Also read about RFI with the mc-60
I read that the 830S rig should not use the amplified mic.
The mc-60 looks a lot nicer than the mc-50, and the amp could be disabled on the mc-60.
so that brings me back to trying to select between the mc-60 versus mc-60A. Is the RFI a big problem? I see there a lot of fixes for it.
hope someone can sort this out for me and help me select a mic.
thanks, Fred

OK, Gordon, We'll try that tomorrow or Tuesday and send the tubes back. Will keep busy while waitingfor them by checking all the resistors in the finals and looking for problems on the RF board.

73, and thanks. ... Jerry K3BZ

Hi Jerry,
YES, Tube has an internal short. No longer usable in my experience.
Only way I know of to find the shorted tubes is swap them with another known good tube one at a time.
You will quickly find the bad one but might have to replace resistors again :)
I would send them back for another pair. They usually will not show a short on a tube tester. They usually only short when they are trying to actually work instead of Idle .
Your Low ALC can be caused by Dirty Band switch contacts for 15 and 10 meters, and/or perhaps some resistors going high in value in that circuit.
While you have the Finals board out to replace the blown resistors be sure to Check all the other resistors in there too with a meter. Looks can be deceiving. I have seen many resistors that physically looked perfect, but were bad when placed across my ohm meter. Take Nothing for granted hi hi..

73,
Gordon

Hi Fred. I would go with the MC-50, which is the desk mic designed for use with Kenwood radios with a 4 pin mic jack. The MC-60 and MC-60A were designed for newer Kenwood radios with an 8 pin mic jack.

You can wire a 4 pin mic plug on an MC-60 or MC-60A. I have heard about the RF problems with the MC-60, but I have not owned one. I believe that the MC60 and MC-60A are both amplified, and both can have the amp disabled.

Just my thoughts.

23478. Ruggedness of the TS-520, et al

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-16 21:44:08 UTC
From: LANSWITCH@aol.com
Topic: 23478 Message: 23478

I have been a lurker on this group for quite some time now, only because I have not had anything to ask and because I don't really have the technical expertise to make any contributions.

Finally I have recalled an incident with a TS-520 that I would like to share.

Many years ago, having replaced my old, tired 12BY7 and 6146's and neutralizing the rig, I had an interesting thing happen. For the next few months I had many fine QSO's, you know the regular kind, short exchanges bantering back and forth and not really long rag-chews. One evening I was engrossed with another Ham in a very long SSB QSO on 40 Meters and had become quite long winded, having ID'ed probably twice without turning over to the other fellow.

Suddenly billows of thick black, foul smelling smoke began to issue forth from the rear of the rig, propelled by the fan. I immediately flipped the Power Switch off and waited for the rig to stop smoking. Fearing what I would find, I cautiously removed the top and bottom covers to see where the scorch marks were on the printed circuit boards, hoping that they would indicate the failed component. Lo and behold, nothing, nada, not even soot, the rig was clean as a whistle.

Being that the only thing I had recently changed was the tubes, I replaced them with the original, old ones I had removed a while back. They were good, just not putting out the full power that they had in the past. I put the rig back together and, with great trepidation, I flipped on the Power Switch. Again, nothing, just normal sounds of the 40 Meter band. I flipped on the Heater Switch and held my breath. Again nothing out of the ordinary, certainly not black smoke again. I tuned up into a dummy load and all was well. I was breathing easier now. I put out a short CQ and was answered in no time.

I kept that rig for the next few years and it never skipped a beat. I figure that one or both of the finals were faulty, but neither of them nor the 12BY7 were discolored internally or externally. I tossed them and thanked the "ether-spirits" that all I lost was the tubes and not the rig. Perhaps it was the gunk inside the base of the finals or something under the Plate Caps, either way that rig never failed me (even when it failed me).

Currently I have a TS-530S, another work-horse of a rig, a TS-130, A Yeasu FT-7 and a MFJ-9320 (both SSB QRP rigs). I'm also building a PSK80 Warbler for my first foray into digital.

Happy Holidays to all and have enjoyable QSO's.

Bob KE9PP

Hi Kevin,

From your post, and the responses so far, I have found Ebay much different here in UK, to the 'US Experience'. .

I have bought my and sold my last 3 cars (all unseen) - A Volvo Station Wagon, Mazda 323, and lastly my Renault Megane 'Scenic' MPV Diesel (it cost me 500 dollars in US money!) that I have now driven for the last 18 months.

I have also, as a Musician, bought and sold Organs and Keyboards, and this last week or so, bought Amateur Radio Equipment - a Kenwood TS 530, 230 ATU, MC 50, and MP-1 Antenna. (Described and pictured on my web site at www.John4Music. TV <http://www.John4Mus ic.TV> Under the 'Amateur Radio' Button.).

Everything I have ever bought has been 'As Described' - I have met some great people, and have never had a bad deal (I am up to over 200 !).

In this country, you can drive to collect, or deliver in most Cities. I am smack bang in the middle of UK, and there is not much that is farther than 200 miles away! If I go due East - the North Sea is about 100 miles, If I go due West, I can bathe in the Irish Sea in North Wales 65 Miles away !! Birmingham (our second biggest City), is 40 Miles South, London 150 Miles South. South Coast about 220 miles!. Liverpool is about 90 Miles North West, and Glasgow (Scotland), is about 250 miles North !!

Although I lived and worked in the US for ten years (and stole one of your beautiful ladies!), I still find UK quite a big place !!

What I am trying to say, is that if someone did 'Rob' you on Ebay in UK, it isn't far to go with the old Fox .410 to give them both barrels, so perhaps we HAVE to play fair!

Some great responses to your post.

Kind regards & 73's

John

Hello All,

As most who follow my posts know, I am just setting myself up a new station, after an absence from Amateur Radio of about 40 years.

Once I had decided to buy a Transciever and the model (I am a pensioner on a low income, so 'bang per Buck' was a major consideration!), I started scouring the internet to glean as much knowledge about my chosen Transciever (The TS 520 SE), and its accessories.

Pictures, Specifications, and articles are in many places on the internet, and during my searches, I was also pleased to 'discover' this Group!, but I had a little 'brainwave' ..... (and it was painful !!)
..HI !

I decided to collate all the information I have gathered so far, specific to the TS 520 all in one place for future 'searchers' and would like to ask for Members to have a look at what I have done so far, and if they know of further articles on Mods, repairs, or information that could or should be included, that is not there, would they please point me to it?

I would also like to hear constructive critique on what I have done so far.

Perhaps a member who (like me!) has time on their hands would like to do the same for their model of Kenwood Transceiver, and in the same format, and I would be happy to host those pages.

My Email is.... jhaddleton@... <mailto:jhaddleton@...>

The web page for the TS 520 is H E R E
<http://www.john4music.tv/27.html>

Kindest Regards and 73's to all,

John

John.
Nice job on the site. you may want to add the details found here at the following link.

http://www.k4eaa.com/types.html

I have owned my TS -520s for many years, she has never missed a beat, original tubes.
Good luck in ur hunt for info.

John, very kind of you to compile this information. I believe the information stating the SM-220 with the BS-8 for the TS-520S is incorrect, I am under the impression the TS-520S requires the BS-5 because the IF is 3395 kHz. The BS-8 is used with an IF of 8830kHz.

http://www.universal-radio.com/CATALOG/hamhf/ts520s.html also shows the BS-5 as opposed to the BS-8.

Thanks and 73,
Nathan / KJ4AUR

Hi John. A couple of details for your site. The driver tube (12BY7A) in the TS-520 series (and the TS-530S also) is NOT in the high voltage cage. I am not sure about the TS-520SE, (check your manual) but the TS-520 and TS-520S had an optional DS1A unit that allowed operation from 13.8V DC.

The TS-520 allowed operation on the 80M, 40M, 20M, 15M, and 10M HF Amateur bands. The TS-520S add the 160M band. None of the TS-520 series could operate on the so called W.A.R.C. bands (30M, 17M, and 12M).

Many Amateurs consider that the Kenwood hybrid radios (solid state but with tube driver finals) and the early solid state models (such as the TS-120S/V, TS-130S/SE, and TS-430S) to have the best RX audio without any modifications. I get very good (sometimes unsolicited) reports on my TX audio using my TS-130SE, TS-430S, and TS-530S. This includes using the radios with the MC-50, or (with the TS-130SE and TS-430S) the stock Kenwood hand mics. The TS-530S gets good reports with the generic hand mic I have on it. I have used other mics, and have never gotten less than a good report on my TX audio.

I have uploaded an article that I wrote about speakers to the files section. Take a look.

Pretty good job on the web site!

Hello Martin,

I read your comments about using a generic hand mike woth your TS-530s and receiving good audio reports. What type of hand mike do you use??? I was looking at some hand mikes at a truck stop on I-84 in Pennsylvania and they all seemed of good construction, had the proper 4-pin connector, and there were models of several different impedances.

I found mikes with listed impedances of 600 ohms, 1000 ohms, and 5000 ohms. All dynamic and obviously built with the professional trucker in mind. I'd appreciate your comments and suggestions. I currently use an MC-50 on my TS-520 but I need something for "on the road" ops etc.

Tnx es 72/73 de Howie K3HW

The 520S requires a "high-impedance mike". A low impedance microphone (200-600) will not have enough output. I would think 5000 ohms might work but no guarantees.
Shure made some hi-impedance hand mikes that provide a very nice quality, but I am not certain they still produce them since all the mobile radio manufacturers switched to low impedance in the late 80's and 1990s.

FYI,

Greg

Hello All,

As most who follow my posts know, I am just setting myself up a new
station, after an absence from Amateur Radio of about 40 years.

Once I had decided to buy a Transciever and the model (I am a pensioner
on a low income, so 'bang per Buck' was a major consideration!), I
started scouring the internet to glean as much knowledge about my chosen
Transciever (The TS 520 SE), and its accessories.

Pictures, Specifications, and articles are in many places on the
internet, and during my searches, I was also pleased to 'discover' this
Group!, but I had a little 'brainwave' ..... (and it was painful !!)
..HI !

I decided to collate all the information I have gathered so far,
specific to the TS 520 all in one place for future 'searchers' and would
like to ask for Members to have a look at what I have done so far, and
if they know of further articles on Mods, repairs, or information that
could or should be included, that is not there, would they please point
me to it?

I would also like to hear constructive critique on what I have done so
far.

Perhaps a member who (like me!) has time on their hands would like to
do the same for their model of Kenwood Transceiver, and in the same
format, and I would be happy to host those pages.

My Email is.... jhaddleton@msn. com <mailto:jhaddleton@msn. com>

The web page for the TS 520 is H E R E
<http://www.john4mus ic.tv/27. html>

Kindest Regards and 73's to all,

John

....\
....\
....

I was Born with nothing ..... 74 years leter, I still have most of it

Look for an older Turner Super Sidekick or a Plus 3. These mics work very well with the older rigs like the Ts 520. They can be found on Ebay and at most every CB shop around for a reasonable price. Of course, the better cond. of the mic the higher the price. I have a cheap $25.00 truck stop power mic here that i use on my TS 530SP and it works rather well. I have told several ops i have talked to what it is and they cant believe it. :-)
It goes to show you dont need to buy a high dollar mic to sound good on the air.

Yes a d 104 will work ok with that 520. Just be sure to turn the audio down. I used to run a d 104 on a Yaesu Ft 101E and had great luck with it.

Subject: [TS-520_820_ 530_830] Generic Hand Mikes for the TS-520

Hello Martin,

I read your comments about using a generic hand mike woth your TS-530s and receiving good audio reports. What type of hand mike do you use??? I was looking at some hand mikes at a truck stop on I-84 in Pennsylvania and they all seemed of good construction, had the proper 4-pin connector, and there were models of several different impedances.

I found mikes with listed impedances of 600 ohms, 1000 ohms, and 5000 ohms. All dynamic and obviously built with the professional trucker in mind. I'd appreciate your comments and suggestions. I currently use an MC-50 on my TS-520 but I need something for "on the road" ops etc.

Tnx es 72/73 de Howie K3HW

D-104
Leave the amplifier in. It is a good idea to place a 10K resistor in series with the live audio mike cord lead inside the mike, usually white. This will lower the level and improve isolation.

If your base is a TUG-8, it should work fine. If it is a TUG-9 it will probably work OK but might rairly have RF issues. Soon I will have an article on how to make the TUG-9 work like the TUG-8 and resolve these issues.

Join the astaticmicrophones Yahoo group. http://groups.yahoo.com/group/astaticmicrophones

In the files section find the article under "D-104 article by N9WB".

This article has a lot of D-104 info and a modification to the amplifier to make it sound even better, more full and smoother, yet still bright. Astaticmicrophones is a very low traffic group so it won't clog up your e mail.

23498. QSO Days, Times & Frequencies

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-18 13:38:16 UTC
From: Noodle10536
Topic: 23498 Message: 23498

Hi everyone, For those interested in getting together on the air, I posted an inquiry on the Kenwood QSO page. It seems like a fun idea to get a QSO going for us Hybrid fans. Thanks & 73, Peter KC2RBX

From the QSO Group Page:
Hi everyone, I was trying to figure out where all us Kenwood Hybrid owners/enthusiasts could get together for QSO's. I searched past posts and came up with a variety of frequencies. Some are in a range that is close. I have to stay within the General bandplan. Are there any days of the week or times of day and frequency ranges that are currently more common for everyone? The frequencies that I found are listed below.

3.815
3.821
3.822
3.824
3.829
3.830
3.831
3.832
3.833
3.845

7.248
7.260
7.263
7.268
7.290
7.295

14.215
14.245
14.255
14.266

In the NY area I can hear a group that regularly meet on 3.818, so I think we would want to stay away from that area for this group QSO. Thanks & 73, Peter KC2RBX

23499. FS: TS-830s Tech Special

Kenwood TS-830s transceiver "Tech Special." Transceiver looks great, works and has good output, but digital display is not moving and occasionally exhibits incorrect info. Switches need cleaning also. There may be other issues, but those are the ones that I found. It is being sold for parts or restoration because of these issues.

I am asking $225 plus $40 UPS Shipping in the Continental U.S. PayPal preferred, otherwise U.S. Postal money order. You can pick it up locally in San Diego to save the shipping.

23500. IF Protection on TS-530S

A 1983 service bulletin from Kenwood mentions protecting IF unit transistors Q2 and Q7 from high voltage transients by installing a surge suppressor in the AF unit. The bulletin gives a part number for this suppressor:ERZD03DK331. However, my research using Google failed to find any information about what this part is, and how I might find one today. Anybody know what this thing is? The picture in the service bulletin makes it look as if it is a capacitor, but I don't know what type, or what values it might have.

Thanks,

Erik

Hi :

I just joined this group yesterday and have already reaped the benefits of your collective knowledge !

I picked up a very nice TS-820S from a friend in a swap for another rig of a similar vintage and brought it home last night only to find that the rig was non-functional. I looked at the manual and noticed the note that the EXT VFO loopback plug needed to be present if there was no external VFO connected. I was quickly able to search the postings on this group to verify that the symptoms that I was seeing were consistent with the missing plug (no digital display, audio but no signals, no TX). A quick note to my friend, he searched the back seat of his van and presto there was the plug, so I should have the rig on the air later today.

These Kenwood Hybrid rigs are amazing workhorses. I first used a TS-820S back in 1980 at the University of New Brunswick's Club station VE1UNB and it was a great rig.

I am looking forward to getting my TS-820s on the air.

Cheers,

Michael VE3WMB

Sounds like the part is an M.O.V. "Metal Oxide Varistor". They are regularly used as surge suppressors in power supplies.

Art,

The head is glued on to the body. Put on work gloves. Use a heat gun (be careful - not too hot) or a hair dryer and heat the junction of the head and body. Periodically try to unscrew the head.

First Have a look at the local oscillator frequencies and level. Then
have another look at the switch wafers.

I am not familiar with the device chosen for the IF amps in the 530. What I would do is look up the device and see what it can handle as a max. voltage swing on the gate. Its probably in the 1-5V range. Then select an MOV to trigger at the top. It will probably be a small-ish MOV. They are made in ranges to cover everything up to hi-voltage....

Unfortunately, the final and driver tubes have nothing to do with the problem you are experiencing.

Since 160 and 80 meters are working, the problem is NOT the VFO.

The SG switch is not the source of the problem either. The SG switch's sole purpose is to control the final amplifier tube's "screen" voltage, nothing else.

Also, there is no jumper required on the rear VFO 8 pin DIN socket like on the 520 and 820. A micro switch embedded in the 830's rear remote VFO 8 pin din socket takes care of the jumper requirement when either the VFO-230 or VFO-240 is not plugged into the rear VFO socket of the 830.

Since you have cleaned the band switch wafers, at the moment I do not suspect the band switch wafers.

The 830 does not have or use individual local oscillators like the 520 and the 820 have. The 820 has individual heterodyne oscillator crystals in it's PD UNIT (part of the 820's PLL UNIT) while the 520 has the individual band switch selectable heterodyne oscillator crystals on the RF UNIT (mounted to the RF UNIT's band switch wafer).

The 830, on the other hand, uses a standard reference frequency oscillator (10Mhz) signal to sync with the VCO and VFO signal to process receive and transmit signals (see service manual starting on page 3).

It's possible the programmable divider may have failed on the PLL Unit board. A logic probe used to compare the actual 830's divider binary output levels to the service manual will determine if the divider has failed (see table 6 on page 4).

It is also possible that one or more of the PLL UNIT's plugs are not making good contact. Removing and cleaning the plugs and pins with contact cleaner and canned air will determine if this is the problem.

Also, check all grounds and PC board mounting hardware/screws, ensure they are tight. Do not use excessive force when tightening the mounting screws as the threads could be stripped.

I recommend downloading the 830 service manual and high resolution schematic from N6WK's website.

www.n6wk.com/kenwood/

Scroll down the page and you will see both, the 830's service manual and the 830's high resolution schematic. These 2 documents are highly recommended when performing any maintenance on the 830.

Review the service manual, especially the circuit description section starting on page 3, before proceeding with any troubleshooting and diagnostic repair.

If your troubleshooting and repair skills are lacking, may I recommend locating a local ham, through a ham club or local 2 meter repeater, that has the troubleshooting and repair skills to help you diagnose and repair your 830.

23515. Re: TS520S TUN position not working

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-19 17:53:17 UTC
From: jaiden0
Topic: 23388 Message: 23515

In looking at the schematic I've noticed that each of these frequencies is exactly 10 mhz under that of each fixed crystal. X1 at 10.695 becomes 0.695 for example. I'm guessing this is a problem with the IF unit, but I don't understand why it would be different in TUN vs CW (or SSB) mode, since it is only broken in TUN.

Any ideas?

Subject: RE: [TS-520_820_530_830] Re: IF Protection on TS-530S

I am not familiar with the device chosen for the IF amps in the 530. What I would do is look up the device and see what it can handle as a max. voltage swing on the gate. Its probably in the 1-5V range. Then select an MOV to trigger at the top. It will probably be a small-ish MOV. They are made in ranges to cover everything up to hi-voltage....

FYI,

Greg

23517. TS-830 Cathode Resistors

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-19 20:38:23 UTC
From: f_canuso
Topic: 23517 Message: 23517

My TS-830 has been experiencing cathode resistor failures while transmitting. Thinking that it might be a bad final tube, I installed new resistors, changed both final tubes (using GE 6146B) and neutralized them. I put the radio back on the air and it worked for a short while before the cathode resistors failed again. Just prior to the resistors failing, I noticed the outpower rising while transmitting.

If anyone can offer a suggestion regarding where to go from here with troubleshooting this problem, it would be much appreciated.

73,
Tony (N2ATB)

23518. Re: TS520S TUN position not working

Topic: 23388 Message: 23518

Remove the DG-5 from the 520S, including all cables between the 520 and the DG-5.

Set the DG-5 front panel slide switch to "COUNTER".

Connect the DG-5's "COUNT IN" rear socket to each of the following sockets on the rear panel of the 520 and note the frequencies displayed.

HET - Change bandswitch to each position should results in each of the RF unit Heterodyne oscillator crystal frequencies being displayed. The frequencies should remain stable until the band switch is set to another position, whether in transmit or receive and regardless of the MODE switch setting. See the RF UNIT of the crystal frequencies.

CAR - Set MODE switch to each position. The CAR UNIT crystal frequencies should display on the DG-5 as you change the MODE switch setting. The frequencies will change "slightly" between transmit and receive and when changing MODE settings. See the CAR UNIT for the crystal frequencies.

VFO - Setting the VFO dial to zero, the DG-5 should display 4.999Mhz. Rotating the VFO dial toward the upper end of the dial, the frequency should increase smoothly and continue increasing to 5.500Mhz when the dial reaches "500". The frequency should NOT change regardless of the bandswitch and MODE switch settings. The frequency should disappear if the jumper between pins 8 and 9 on the rear 9 pin VFO socket is removed. The frequencies should return when the jumper between pins 8 and 9 is reinstalled.

This verifies the stability and functionality of all 3 oscillators in the 520. There are no other RF oscillators in the 520.

I haven't reviewed all of your post but from what I have read, I seriously doubt the IF UNIT itself has anything to do with your problem.

The one thing that is quite clear and that is, the 520 is working properly, at least from your statements, in ALL modes except "TUNE". That means you can tune the 520 up in CW mode. If this is done there will be no ALC indication in CW mode regardless of the CAR control setting. You will have to peak the "IP" meter. Therefore, there can't be much wrong with the 520 in TUNE mode, possibly a bad connection on the MODE switch or a resistor that has changed values on the HV UNIT, or a broken wire on the MODE switch, relay terminal, or a wire wrap that is affecting a voltage applied to a circuit that affects the RF output of one or more of the RF oscillators to the DG-5 which also affects the 520 in TUNE mode.

I recommend reviewing the 520 schematic and tracing the MODE switch wiring.

23519. Re: TS-830 Cathode Resistors

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-19 21:34:51 UTC
From: w5rkl
Topic: 23517 Message: 23519

When you say the "RF increases" how are you determining the RF is increasing? A watt meter or the 830's IP meter?

If it's the 830's IP meter that is increasing and not due to audio from the microphone but without no audio in sideband and the CAR control set to minimum in CW or TUNE, then the meter is not displaying an increase in RF output but rather an increase in plate current that may be caused by a failing bias supply (-C on the Rectifier Unit).

Mike,

Thanks for the reply. The output was being measured on an in line peak reading watt meter. I was transmitting in CW mode on 40 meters into a resonant antenna and noticed the output power rising from about 80 watts to around 110 watts right before the resistors failed. I did not notice if the plate current was also increasing.

All these frequencies are very high in the band for me ! I operate around 3550 on 80M.
I have been told the note from my TS 520 sounds better than from my TS440s when comparing them on the air.

Hi everyone, For those interested in getting together on the air, I posted an inquiry on the Kenwood QSO page. It seems like a fun idea to get a QSO going for us Hybrid fans. Thanks & 73, Peter KC2RBX

up with a variety of frequencies. Some are in a range that is close. I have to stay within the General bandplan. Are there any days of the week or times of day and frequency ranges that are currently more common for everyone? The frequencies that I found are listed below.

3.815
3.821
3.822
3.824
3.829
3.830
3.831
3.832
3.833
3.845

7.248
7.260
7.263
7.268
7.290
7.295

14.215
14.245
14.255
14.266

In the NY area I can hear a group that regularly meet on 3.818, so I think we would want to stay away from that area for this group QSO. Thanks & 73, Peter KC2RBX

23525. TS-570 versions

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-20 11:10:07 UTC
From: k4jdp
Topic: 23525 Message: 23525

Why were these discontinued so quickly? They were only marketed a couple of years. Was it receiver problems that I've read about or something else?

73's de K4JDP-John

23527. Re: TS-830 Cathode Resistors

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-20 14:56:51 UTC
From: w5rkl
Topic: 23517 Message: 23527

Tony,

It appears, based on your initial comments and recent response, the problem may be in the 830's Rectifier Unit -C bias supply, the AF UNIT's bias/ALC circuit which includes the bias pot, or both.

A very dirty bias pot can affect the stability of the bias voltage applied to the final tubes in transmit and/or receive.

Try thoroughly cleaning the bias pot then reset the final idling current to 60ma and monitor the IP current during normal use.

If the IP meter and the external watt meter, during normal operation, continues to show an increase in output for no apparent reason to the point where the cathode resistors will destruct, then it's quite possible the problem is in the Rectifier Unit's -C bias supply, possibly one or both 33ufd 160VDC filter capacitors are failing.

> Thanks for the reply. The output was being measured on an in line peak reading watt meter. I was transmitting in CW mode on 40 meters into a resonant antenna and noticed the output power rising from about 80 watts to around 110 watts right before the resistors failed. I did not notice if the plate current was also increasing.

If I remember correctly, it had something to do with stricter European compliance rules for a number of their components used in the TS-570 series. It was, I guess, a lot easier to discontinue the series then try to design to the newer/stricter rules.

Tony,

Could be the coupling condenser between driver and finals, a common problem in other sets. If this condenser is leaky, the bias of the finals are going more positive and the tubes draw more current.

It is C1 on the final board, 100pf/1Kv, to be changed with a higher voltage type. I used ceramic types with 5Kv, they work good for several years now.

My memory is that the TS-570 was produced from 1997 to approximately 2006, a period of 9 years -- it was around for a lot more than a "couple" of years. It was an excellent rig (I owned two of them -- DG and SG) and they simply fell to advancing technology when the TS-480 was introduced.

23531. TS-830 No TX at all

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-20 20:33:06 UTC
From: ah6rr1
Topic: 23531 Message: 23531

Hello all I am looking at a TS-830 for a local handicap Ham. The radio has RX but no TX at all no ALC indication nada zip. I checked the voltages on the driver and finals and they are as follows
Driver
Pin 1 RX 0V TX 0V
Pins 2&3 RX -47.3 TX .4
pins 4-6 RX 0 TX 0
Pin 7 RX 247 TX 239
Pin 8 RX 334 TX 324
Pin 9 0

Finals V1 & V2
Pins 1,4,6 RX 0 TX .316
Pin 2 RX 12.7AC TX 12.3AC V2 RX 6.34AC TX 6.31AC
Pin 3 RX 256 TX 241
Pin 5 RX -102 TX -57
Plate Voltage is RX 955 TX 955
The Relay on the AF board is working.
I followed the TX signal to the diver tube then to the finals and I have signal all the way to the finals. But I get no ALC indication at all.
TX set for CW 14.200 and I get a 14.200 signal all the way to pin 5 on the final tubes the scope shows a good signal also. I did check the Grid resistors in circuit and they all read 5.9 ohms
Any hints on where and what to look at next?

Thanks
Roland AH6RR

23533. For Sale: Kenwood TS-830

Kenwood TS-830 Transceiver.
Radio work great 130 watts on CW. No band selector issues.
Radio comes with original RCA 9146A Tubes.
SSB Filter. No CW filter.
No microphone. Radio only.

Radio appeared to be modified and later modification removed from previous owner since it has a patched hole.

I am selling it because I have a second one and I can use the cash right now.

$375.00 Firm. I can ship, but don't know how much it would cost to ship.
I am located in San Francisco Bay Area (San Jose).

Roland,

You didn't state whether the final amplifier's IP meter setting, in USB or LSB, indicates 60ma idling current with no audio applied to the microphone, in transmit.

If the IP meter indicates "zero" then the final amplifier bias is not set. Turn to page 17 in the operator's manual and perform the bias setting.

If you do not have the 830 operator's manual you can download it free at the following website:

www.n6wk.com/kenwood/

CW mode does not use ALC to control the output level, the CAR control controls the output level. Therefore, placing the meter switch to ALC in CW transmit, regardless of the CAR control setting, there will be zero ALC indication on the meter.

The meter will indicate ALC in TUNE mode but the ALC indication is for tuning purposes only. ALC in TUNE mode does not control the RF output. The ALC meter is used in TUNE mode for tuning purposes only, peaking the drive to the final tubes, same as the old transmitters that peaked the "Grid" drive.

Aloha Mike & Gordon,
The IP reading is ssb is 60mils and in cw it goes to 120 after some unplugging and plugging back some of the wire plugs on the IF and AF boards it is now transmitting full power but I still get no ALC indication in SSB. I will look at the service manual and see if I can trace the ALC circuit.
Anything in particular to look for?
Thanks
Roland AH6RR

Roland,
I recommend removing the IF board and checking the pins on every
connector where they solder to the Board. I think you are going to find
some loose ones.
Very Common problem too.
Also, It happens to the connector terminal pins on the RF board very often.
Occasionally I see it on the PLL board but not quite as often. Usually
on the PLL board it is connector 7, it seems to me , that becomes loose.
Still, I would start with that IF board.
73,
Gordon

My understanding is that Kenwood was unable to meet RoHS requirements in the EU due to non-availability of certain components in lead-free versions (specifically certain ICs), so they decided to discontinue the model, rather than attempt to redesign it to meet the spec.

They are fine transceivers IMHO, and a still a great deal for a DSP rig. I've never heard any complaints about the receiver in the TS-570.

Hello, John.
I am no expert, but I purchased my TS-570s in Dayton in 1999 and I have a QST with it advertised in 2006. I have had a ball with this rig. May not compare to some of the big high end rigs that are out there but for the price I think it has excellent receive with the optional filters installed. It is very versatile and I have never had any problems with it. It is my primary rig and still use it on a daily basis. I recently purchased a newer compact "do everything" rig of a different manufacturer and it's a big disappointment compared to the 570.

73, John.

Hi Don. I did not find a source for a free pdf version of the manual. Apparently one can be purchased from vintagemanuals,com.

I did find a picture. It is obvious that this is a pre-W.A.R.C. band tuner, so it may be of limited use on those bands. I am not sure that the Select 1 and Select 2 settings on the band switch are for unless they bypass the tuner. The tuner seems to be able to measure power up to 200 watts. Here is how I would proceed:

Set the band switch to the desired band. Set the Function knob to set, and the A Tune and B Tune knobs both to 5. Set the radio to CW and turn the power all the way down. Key the radio, and try to get a full scale reading on the meter by adjusting the set knob (marked Set to Full Scale). If you cannot get a full scale reading with the Set knob fully clockwise, turn uo the power slowly until you can. Unkey the radio. I would try this first with a dummy load connected to the antenna port of the tuner, then connect an antenna.

With an antenna connected, adjust the A Tune and B Tune knobs for the strongest signal or noise in the receiver. Set the Function knob to measure, and read the SWR from the SWR scale on the meter. If it is 1.3 or less, then you are good. If not, alternately adjust the two Tune knobs to try to get the swr to read less than 1.3. Do not key the transmitter for extended periods of time, I would not key up for more than 10 seconds at a time. Also, make sure that you are set on a clear frequency, as you will be transmitting a signal on the air.

Once you have gotten the best SWR that you can, write down the frequency and the settings of the band, and Tune knobs. Once you have done this, you can pre-set the tuner to those settings for that frequency of frequencies near that one. I have the tuner settings for my favorite frequencies recorded, and have made a chart of the frequencies and tuner settings. By carefully pre-setting the tuner, I can set things quickly with a minimum of on-air transmissions.

Thanks for the info Martin. From what I've found, they were made in the early 70's and covered the basic 10 - 80 meter bands. I looked but could only find a manual at Vintagemanuals also. I use a tuner on a 80 meter loop so I am familiar with them. Have my own cheat sheet also for quick setup. Started writing up an instruction sheet for him last night and will mix it with your notes to make it easy for him to follow till he gets the hang of using a tuner. He has a TS-530 and a couple dipoles up now, but wanting to put up a loop for better band coverage instead of having multiple antennas.

The Direct 1 position only connects the TX jack to the Direct 1 jack for a resonant antenna or a dummy load. The Direct 2 position connects the TX jack straight thru to Direct 2 jack. The band freq positions connect the TX jack thru various coils and caps to the Direct 2 jack for tuning. (I opened it up to figure it out)

Hi Don. I did not find a source for a free pdf version of the manual. Apparently one can be purchased from vintagemanuals, com.

I did find a picture. It is obvious that this is a pre-W.A.R.C. band tuner, so it may be of limited use on those bands. I am not sure that the Select 1 and Select 2 settings on the band switch are for unless they bypass the tuner. The tuner seems to be able to measure power up to 200 watts. Here is how I would proceed:

Set the band switch to the desired band. Set the Function knob to set, and the A Tune and B Tune knobs both to 5. Set the radio to CW and turn the power all the way down. Key the radio, and try to get a full scale reading on the meter by adjusting the set knob (marked Set to Full Scale). If you cannot get a full scale reading with the Set knob fully clockwise, turn uo the power slowly until you can. Unkey the radio. I would try this first with a dummy load connected to the antenna port of the tuner, then connect an antenna.

With an antenna connected, adjust the A Tune and B Tune knobs for the strongest signal or noise in the receiver. Set the Function knob to measure, and read the SWR from the SWR scale on the meter. If it is 1.3 or less, then you are good. If not, alternately adjust the two Tune knobs to try to get the swr to read less than 1.3. Do not key the transmitter for extended periods of time, I would not key up for more than 10 seconds at a time. Also, make sure that you are set on a

clear frequency, as you will be transmitting a signal on the air.

Once you have gotten the best SWR that you can, write down the frequency and the settings of the band, and Tune knobs. Once you have done this, you can pre-set the tuner to those settings for that frequency of frequencies near that one. I have the tuner settings for my favorite frequencies recorded, and have made a chart of the frequencies and tuner settings. By carefully pre-setting the tuner, I can set things quickly with a minimum of on-air transmissions.

I did remove the IF board and found no problem there so I went to check all the ALC componets and found Q19 on the AF board had -104 volts on all 3 legs it should only have -104 on 2 legs and 1 should have 3.0V RX and 2.6V TX so I am thinking that Q19 is bad. Luckly I have a parts radio and hope it fixes it.

23549. MC-60 wireing errors

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-21 23:08:02 UTC
From: Walter Breining
Topic: 23508 Message: 23549

Please keep in mind that Many MC-60 and MC-60A mikes have a wiring problem. This is particually true of the MC-60A. Inside the mike itself, the wires on pins 1 and 7 are reversed. The schematic in the manual is also wrong.
With this error, the mike case is how with the live audio.

This cannot be checked with an ohmmeter.

On the plug on the bottom of the mike, Pin 1 should be the live mike audio (white) and pin 7 should be the shield ground. Pin 7 should connect to the mike case inside of the mike itself.

The plug on the bottom of the mike is threaded into the mike case and the threads are glued. Carefully heat the outside of the male plug on the bottom of the microphone case with a soldering iron to soften the glue and unscrew the plug Counter Clockwise. Inside the live mike audio wire (white) should connect to pin 1. This wire comes from the switch inside the mike. A wire that connects to the microphone case should connect to pin 7.

If your mike has this error, correcting it will correct many problems the MC-60 series mikes often have.

Hi Kevin,

I use an MC-60A with the amplifier (OFF) on my 520SE. Works great, sounds very good from reports I get. With the MC-60 I find that the mic. Gain is set around 40% with the processor off and a bit less with it on.

FYI,

Hi all

I also use a MC-60A on my TS-830. At 100w, the wiring reversal never
appeared to cause any problems.
It was only when I started using a Linear amplifier that the reversal
became a real problem with regards to RF feedback..
Another amateur alerted me of this wiring issue, and indeed mine was wrong.
Once the wiring was put straight, the RF feedback problem was eliminated.

Roland,

It appears from your voltage measurements that Q19 on your 830's AF UNIT is shorted emitter to collector.

I also recommend checking the 9 volt zener diode D21 (WZ-090) as it may have been permanently damaged with -104VDC applied to it's cathode.

A possible replacement is a 9.1 volt 500ma zener from Mouser. Mouser part number 621-1N5239B-T (axial lead) and the price is 23 cents. Mouser has 9,661 of these in stock ready to ship.

The pdf document sheet for Q19, 2SC1515(Y), can be found at the following link:

http://www.datasheetcatalog.com/datasheets_pdf/2/S/C/1/2SC1515%28K%29.shtml

If you are unable to retrieve Q19 from your parts radio but you locate a suitable replacement, ensure you pay close attention to the lead orientation.

Not all TO-92 transistors have the same lead orientation. The 2N2222, for example, also comes in a TO-92 body and with the flat side facing you, the 2N2222 leads are "Emitter, Base, Collector" where as the 2SC1515(Y) leads are "Emitter, Collector, Basie".

The 2N2222 NPN transistor will NOT work as a replacement for the 2SC1515(Y). I only used the 2N2222 transistor in its TO-92 enclosure as an example of the lead orientation differences between the 2 transistors and the important of noting the differences before installing a replacement for Q19 on the AF UNIT board.

23552. TS-520SE meter reading

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-22 13:06:53 UTC
From: Peter
Topic: 23552 Message: 23552

When the function switch on my 520SE is set to either TUN or CW and the AGC is on either fast or slow the meter is up to the L in ALC. Is ther an adjustment that needs to be made?

23553. Antenna ideas for TS-520SE

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-22 05:09:46 UTC
From: James Allen
Topic: 23553 Message: 23553

Hi everyone. I'm a bit new to the group but I have enjoyed reading the conversations that I have seen so far. I have a TS-520SE that I really want to get on the air but sicne it is my first HF radio I do not have an antenna for it yet. I don't have a lot of space available as I live on a very small lot (about .12 acres or so I think) but I did figure out that I have enough of a run around the edge of my roof to fit a 80m dipole or equivilent (not a 160 unfortunately though).

The problem I am facing is that I would really like to put up a single antenna that I can work all the bands available on my radio from 80m to 10m without using an antenna tuner, since at this point even buying supplies to build a simple antenna would be difficult to manage. I have heard that the pi-network in the TS-520SE can handle varied SWR's before any adverse affects, but I have not seen just what this setup is capable of handling.

So here are two questions. First, how effective is the pi-network in the 520SE and what are its capabilities as far as tuning into antennas? Second, what antenna designs would you suggest to be able to cover the 80m-10m bands available on the 520SE (off the top of my head I think they are 80m, 40m, 20m, 15m, and 10m. I could be wrong on the 15m though) that I could build for as little investment as possible and will be able to hook directly into the radio (so no external tuner, I do not have the money for one. If someone wants to give me one for free I'm all over that! Even if it needs repair.) and have installed on my roof, whether it is around the edge or what. I live in a rambler style house that has a footprint of about 50' x 45'.

I've been looking for a while now at different designs but cannot figure out for the life of me which one to try. I'm still fairly new to amateur radio. I got my liscence about a year and a half ago, but i've been worknig on electroncs, computers, and robotics for about 15-20 years or so now. I actally bought the 520SE as a fixer-upper, fortunately for me there was not much wrong with it in reality. I was able to learn how to tune it into a dummy load a friend lent me, now I just need an antenna to start really using the thing and learning more about this hobby of mine. I appreciate any help you guys can give me!

Topic: 23553 Message: 23554

Hi James. The manual for the TS-520SE says that you must operate the transceiver into a 50 ohm dummy load or antenna that has an SWR of 2:1 or less. You will need a dummy load to tune up the transceiver in any case. I built one recently for a friend, they are fairly simple. No matter what type of antenna you end up with you will need an SWR meter, or the help of a local ham that has one.

There are multi-band vertical antennas, but even used they are fairly expensive. A multiple dipole (several dipoles with a single feed point may be an option. If there is any way to get the antenna above or away from the house it will work better.

You wouldn't need the latest model tuner. A few of years ago I bought an MFJ Versa Tuner 941 (no bloody A, B, C, or D!) for $20.00 (shipping included) Something like that would work well with your radio, and has the capability to let you use coax or ladder line to feed an antenna. You could use a random wire or an 80M dipole for all of the bands you mentioned. Pretty much any antenna that you come up with is not going to cover the entire 80M band, nor even the voice segment with a 2:1 or less SWR anyway.

Feed-line is another consideration. Coax is fairly expensive. Ladder line is less expensive, but you will need a balun at the transceiver, and maybe one at the antenna feed-point (depending on the antenna type)and they are expensive too.

You best bet is to contact a local Amateur Radio Club. Someone there can look at your situation, and make suggestions. They may even be able to help you a bit with getting your station on the air.

TTYL and good luck!

Hello James, my 75m antenna is a Ham Stick dipole, vertical w/3' offset from the mast. The mast is grounded to the negative (lower portion of the dipole) and acts as if were part of the antenna. It has a 40 kc span but functions perfectly through out the voice band w/tuner.

My 40-20m antenna is a 39' wire w/300 ohm twin lead intertwined to make up the capacitance. This is 30' above ground from peak to peak. House is 45' long.

Ingenuity is the mother of all invention for antennas and how to support them. The masts are from ground level supported @ the peak w/a hinged tilt over @ 2' above the peak. Rope and pulleys raise and lower the wire.

A Shakespeare Big Stick works well on one mast for 10 &12m (w/tuner)!

Good Luck!

Harry, k6aom

First the antenna is not so much of a problem than the feedline losses you get with odd lengths that are not resonant on the various bands you want to use a single run of wire on. One solution is a trap vertrical . It is designed to give a good match to a 50 ohm coax feed on the bands it is designed for.
Used antennas can be found at bargain prices..
 A vertical also has a low angle of launch and is good for DX if that is a goal for you. Alternatively the horizontal trap dipoles are great for shorter distances and will have strong signals across north America.
 Again good match for the bands it has traps for. Coax feed with low losses and no tuner is required.
You can build your own traps for the bands you wanted to use from plans in various antenna books or on the net.
These antennas will have a very low SWR on one freq (you choose the freq by adjusting the ant when you put it up) and gradually worse as you go up or down the bands.
The Pi network in your rig will have no problem tuning up across most of a band.
Good luck...73.....JD

To: "ts-520_820_. I don't have a lot of space available as I live on a very small lot
The problem I am facing is that I would really like to put up a single antenna that I can work all the bands available on my radio from 80m to 10m without using an antenna tuner. I have heard that the pi-network in the TS-520SE can handle varied SWR's before any adverse affects, but I have not seen just what this setup is capable of handling.

So here are two questions. First, how effective is the pi-network in the 520SE and what are its capabilities as far as tuning into antennas? Second, what antenna designs would you suggest to be able to cover the 80m-10m. I appreciate any help you guys can give me!

My 40-20m antenna is a 39' wire w/300 ohm twin lead intertwined to make up the capacitance.
This is 30' above ground from peak to peak. House is 45' long.
He did not want to use a tuner and you can't hook twin lead to the rig directly

A Shakespeare Big Stick works well on one mast for 10 &12m (w/tuner)!
He didn't want to use a tuner
Good Luck!

From: aschichler
Topic: 23560 Message: 23560

I have a very nice TS-530S that I have decided to sell. It is very clean, in very nice condition, and has the CW filter installed. Everything works 100%.
It has been aligned within the last 2 years and everything is still right on. Also, all controls and switches are clean and work perfectly. Cosmetically about a 9 out of 10 (very slight scratches here and there), functionally a 10 out of 10. I have pictures I can send to anyone interested. If the buyer isn't 100% satisfied, I will return the full cost of the radio (minus shipping).
Also, if someone is not interested in the CW filter, I am willing to remove it for $50 off the total price.
Asking $375 plus shipping.

Thanks,
Al, WA2AS

The 520's LOAD section of the PI Network should not be viewed as an Antenna Tuner. The 520's LOAD control has a limited range, 50 to 75 ohms, that it can match.

While it's possible to wrap a loop around your house's eve and operate on all bands, the efficiency of an antenna of that type will be considerably less than an simple all band Hustler 4, 5, or 6BTV vertical, ground mounted with 20 radials buried a couple of inches below the ground and fed with RG-8x coax cable.

Verticals are ideal where limited real estate is a problem. When using verticals, is important to follow the manufacturers assembly and mounting instructions. Ground mounting does not require that each radial for each band be cut to resonance.

You didn't say so so I'm going to assume you are living in an HOA "no outside antenna" subdivision. If that's the case, you might consider a flag pole antenna. See the link before for details on the Force 12 Flag Pole antenna.

http://force12inc.com/32822/index.html

Any vertical will result in a higher noise level than a horizontal antenna. Simple dipole antennas will be much quieter than a vertical.

Multi-band dipoles will work without a tuner but their length becomes an issue if you have limited space which I believe you said you did not have a lot of space for antennas.

The G5RV is a good all band antenna but a tuner "IS" required between the 520 and the antenna or, if you are using an amplifier, between the amplifier and the antenna. The G5RV comes in a number is lengths. I use the 102' G5RV on 40 thru 10 fed with RG-8x from a Drake MN-2000 tuner. Works very well. It's a bit noisier than my 40 meter dipole but it works very well. I use it on 80 meters but the bandwidth is very limited even with the tuner.

These are only a few suggestions for antennas. Look around the Interent, AES, for example, sells a wide variety of antennas (HF, VHF, UHF and above) at a variety of prices that may fit your needs.

http://www.aesham.com/

Experiment with different types of antennas. Purchase a copy of the ARRL's antenna handbook from the ARRL's website.

23563. Antenna ideas for TS-520SE

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-22 21:16:00 UTC
From: Allan Cridland
Topic: 23553 Message: 23563

Hi Paul,

I have found that an off centre dipole is a great multi-band antenna. It will give you coverage on 80, 40, 20 & 10 meters without the need of a tuner, but a tuner would be needed on 75 & 15 meters. I use one at home and have a portable one for field work (mainly JOTA). You would need a 4:1 balun and two lengths of wire 90 feet and 45 feet. I usually set it up as an inverted "V" with a centre height of 35 ~ 40 feet. The end to end measurement should work out to be 118 ~ 120 feet. If this will fit into your allotment, it is a great alternative.
A smaller dipole or vertical could be set up for 15 meters fairly easily or alternatively wait until it is affordable for you to purchase a tuner.

Hope this helps in you quest.

Hi again,

If an OCD (off centre dipole) won't quite fit into your small allotment, it is possible to bend the ends of the dipole without any major degrading of it's performance.
Also, the ends only need to be 8 ~ 10 feet above ground level.

I have looked at the OCD and considered it. I have enough run around the edge of my roofline to fit one in the shape of a "U." I know this will likely change the radiation pattern of it, but I am willing to accept some compromises in performance.

Do you think I should use standoffs for putting up the antenna, or is would it be ok to have it within an inch or so of the roof? I am thinking of using the christmas light clips that you can get to put up the antenna since it would make the job extremely easy for me. The ones I am referring to is the type you see at Lowes and Home Depot where it comes with an extendable handle that you screw the clips onto and then they slip under the shingles or can clip onto your rain gutter. I know it would not be a long term mounting solution but it'd be enough to get me through the winter, plus I already have a bunch of them.

Also, do you have a link for the type of OCD you are thinking of? I know there are several variants out there.

Thanks for the help!

Any ideas on what would make the TS-820 volume drop on receive intermittently? It seems to happen more often just after I finish transmitting, but it will do it while just receiving also.
It's not the volume reduction associated with propagation, (I can tell the difference), but something internal to the radio. The volume will drop to about 1/2 level, then just come back up to normal for no apparent reason.

Topic: 23553 Message: 23568

wow, lots of replies! Thanks guys!

A few things to clarify. First, I am fortunate and do not live in an HOA, so I can do quite a bit. Second, I was lucky and was able to pick up some slightly used coax for a good price a the same time i bought my radio, about 60+ feet of it so I can go from the front of my house where my radio is all the way to the back and up to the roof if I want, so I can any antenna pretty much anywhere on my property. I cannot remember the type off hand but it is the large sized coax (about 1/2 diameter).

Third, I thought about a vertical, but the problem is I would have to put it in my front yard most likely since my back yard is almost non-existent. My yard's footprint is about 100'x55' in the shape of a parallelogram. And my front yard has a flowering Pear tree smack in the middle, so I might be able to put the antenna there if it's a vertical, but I don't know how the tree would interact with the antenna, plus my understanding is that I'd need a tuner for the vertical, especially to cover multiple bands. I also know that I need to have some fairly long radials installed, and the longest I'd be able to have is maybe 20 feet or so.

I'm not trying to be super picky, but money is an issue right now (I'll be luck if I can buy anything at all for this), and I mainly want to get up something before winter really hits here in Utah. I don't plan on whatever I put up being a permanent solution, just a stop gap till next year when I have a better job and more money to invest in a decent antenna. And when I move out of the place we are in now, a bigger yard is way up there on the needs list, so I will be happy with just getting on HF finally.

Hi Paul,
Not sure how anOCD would perform in a "U" shape.
If your gutters or facia board is made of a steel or aluminium, I am sure their would be some sort of interaction.
The OCD is best suited a an inverted "V" which gives it an omni-dierction pattern (best radiation would be towards the longer side of the antenna.
Noticed in your later post that you have 100' available...just bend the last 20' of the longer side at 90 degrees. Should work just fine.
There is plenty of information on the web, just google OCD or windom. Try this one:

Sounds like the relay contacts, try cleaning them. The receive signal passes through a set of NC (normally closed) relay contacts which open when you key up then close on key down so if they are dirty or corroded or pitted you would get these symptoms.

I tried hooking up an external speaker and a set of headphones, but the problem still continued. I have not yet tried (DeOxit) cleaning the AF Control POT, if that is what you mean by AF control, however the symptom does not seem to be in the AF knob. There is no static or broad volume changes when turning the AF knob, like what I'm used to when the volume control on other electronic items need cleaning. It just raises the volume in a smooth manner.
It acts like it might be a relay sticking or in need of cleaning, but I am just guessing there. I noticed that even while the heater switch was off, (so it wouldn't transmit), that keying the mike would cause the symptom to re-appear. The volume and the S-Meter would drop, then after clicking the mike button several times, it would suddenly come back to normal volume and S-Meter readings.

The relay in question is located on the bottom, between the final amplifier pc board and the rear panel. Remove the small metal enclosure and pull the relay from it's socket.

Pry the plastic cover from the relay using a thin jewelers flat blade screw driver.

Use contact cleaner applied to a piece of bond paper, slide paper between contacts until the paper no longer turns black.

Use canned air to remove excessive contact cleaner and any debris remaining after cleaning. Install plastic cover, plug relay into it's socket, and check for proper operation.

RL1 and it is somewhat hidden under a small metal cover. With the bottom cover off and with the back of the 820 facing you look to the rigt rear corner (close to where the antenna SO239 is mounted) and you will see under the metal cover. You will have to remove the screws holding the cover in place to gain access to the relay to pull it out of the socket.

Sounds like the relay contacts, try cleaning them. The receive signal passes through a set of NC (normally closed) relay contacts which open when you key up then close on key down so if they are dirty or corroded or pitted you would get these symptoms.

Any ideas on what would make the TS-820 volume drop on receive intermittently? It seems to happen more often just after I finish transmitting, but it will do it while just receiving also.
It's not the volume reduction associated with propagation, (I can tell the difference), but something internal to the radio. The volume will drop to about 1/2 level, then just come back up to normal for no apparent reason.

Paul,
Ever tought of making your own tuner?
All you need is a coil, that you can wind yourself on a piece of plastic tube, and one or two variable condensers from the junkbox.
Look in the various amateur magazines for examples or go to the site of Frits, PA0FRI, the Dutch Antenna Guru.

But, you have already the coax, make a dipole of 2x20 meters and wire it away in the form of a Z or with more zig-zags to get the lenghts in the air.
That way the feedpoint is between 50 and 75 ohms, and you can get the SWR rather low. By cutting the ends of it you can bring the SWR down.

This can be used temporary from 80 downward. If you are in better shape you can always upgrade to a better solution.
Remember: there is no antenna that does'nt work.

I for one have never ever bought an antenna, and the ones I build were always better than the ones of my buddy, who spend a lot of money on them.
So take courage, hang a piece of wire where you can put it in the air and if we get some propagation, we will meet on the air.

Success, 73, Wim PA0PGA

That looks like a discontinued Panasonic varistor, Try the ERZV05D331 instead. The 03 is the series (size), and the 331 is the Varistor voltage, in this case, 330 V.

Have a look at a 1/2 G5RV. It's really easy to make. Get some twin bell wire or speaker wire. When you make the ladder feed, cut the spacers from old plastic margarine tubs or similar, about 2 1/2 inches long with a drilled hole in each end. Use cable ties to attach the wire to the spacers. Separate the twin wires as you build the ladder so the wires don't get tangled. You won't need a balun and you won't need to buy insulators. Just terminate your coax to the end of the ladder feed making sure it's waterproof. Use sea fishing line to tie off the antenna to where ever you're tying it up to. It'll stretch when the wind blows. Don't worry about the influence of the trees, every site is different and the same antenna won't work the same at every site so experiment. Add a bit of wire or take a bit off and see what happens and don't bother with radials ......it's a sort of dipole so radials aren't important.

Just experiment and have fun.

Chris

I also forgot to mention that the TS-530S has two connectors that were added on the back. One for "IF Out" that can be used to connect to an SM-220 with Pan Adapter or similar, and also an output for an external receiver.
In addition to those, it has an "audio in" line connected to the unused (pin 7) pin of the "Remote" Din connector on the back. I used that for PSK-31, but it can be used for SSTV, RTTY, phone patch, or anything needing external audio-in.

From: Music Maker
Topic: 23480 Message: 23585

..
.
Hello All.

May I firstly thank so many who have either posted here, Emailed me, or written in my Web Site Guest Book.

I have taken all the suggestions and corrections on board, and (hopefully !) incorporated them into the Pages.

You have all been so helpful - Thank you !!

I have now added quite a lot of newer items to the pages, which are a 'Dedicated' collation of everything I can find on the TS 520 Series. Today I added all the 'guff' on the SW 2000 Power and SWR meter - as I have just bought one on Ebay, for 40 dollars !! A video is included there as well, for good measure.

The pages are at The Kenwood TS 520 Pages <http://www.john4music.tv/27.html> if anyone can think of anything I have omitted, I would appreciate their input.

On to other things ..... Kenwood speaker Mod .....

I also bought an SP 23 speaker over the weekend. Very good, but as the owner of a fine pair of ears (I am a pro musician!), The sounds were very 'tinny'. Hey Ho - I realised that everything off the 'back' of the speaker was bouncing around inside that big square tin, with nowhere to go.
Necessity is the Mother of Invention, and as I had paid quite a lot for this Kenwood tin with a speaker, I decided to 'invent' !

Firstly, I drilled (neatly) about 20 X 1/4 inch holes in the back. (no-one sees that!), and then I packed the whole of the inside with corrugated cardboard, rolled up so that the holes went from front to back, and the same length as the inside of the speaker box. I carved out the shape of the back of the speaker - (Its called a 'baffle', guys, just the same as a vehicle silencer (muffler US!), and then sealed the tin down with the screws. Wow !!! What a difference! I can really recommend this as a totally 'non-destructive 'mod' to any Op using one of these empty speaker cans. Cheap and quick to do too. !!! I suppose you could fill the space with acoustic wadding, or similar, but I didn't think of that until now !!

I am still hunting for a VFO 230 and a SM 220 if anyone has one .... Even at the terrible cost of postage to the UK from US !!!

Finally .... Congratulations are in order! .... last Saturday, I was re-issued with my old callsign that I havn't used since 1968 (originally issued in 1955!), so old 'Blue Eyes' will soon be putting a signal down your wires as G3OBU .... Just got to get some of my own wire into the air first!

73's de G3OBU, Op John

Hi TS-520s etc Gang,

I would like to obtain an original MC-10 Hand Microphone originally available for the TS-520. It is unique in that it's output impedance is 50k ohms.

Tnx es 72/73 de Howie K3HW

I don't remember off the top of my head, but I think there was a section in either the instruction manual or the service manual that told you where to put it. Or I might have used a TS-830S (which has an IF out jack) service manual as a reference, and put it in a similar location in the IF circuit. I can look up more info on it when I have time.

73,
Al

Eureka!!!

I would have never found the relay without your description! I pulled it out, and ran some VERY fine sandpaper LIGHTLY across the contacts, then sprayed it with DeOxit, and used compressed air to blow it dry. I put it all back together and it is working like a charm right now. I'll have to see how long it lasts, but so far, it is fixed.

Thank you for all the help!!

RL1 and it is somewhat hidden under a small metal cover. With the bottom cover off and with the back of the 820 facing you look to the rigt rear corner (close to where the antenna SO239 is mounted) and you will see under the metal cover. You will have to remove the screws holding the cover in place to gain access to the relay to pull it out of the socket.

Sounds like the relay contacts, try cleaning them. The receive signal passes through a set of NC (normally closed) relay contacts which open when you key up then close on key down so if they are dirty or corroded or pitted you would get these symptoms.

Any ideas on what would make the TS-820 volume drop on receive intermittently? It seems to happen more often just after I finish transmitting, but it will do it while just receiving

also.
It's not the volume reduction associated with propagation, (I can tell the difference), but something internal to the radio. The volume will drop to about 1/2 level, then just come back up to normal for no apparent reason.

The relay in question is located on the bottom, between the final amplifier pc board and the rear panel. Remove the small metal enclosure and pull the relay from it's socket.

Pry the plastic cover from the relay using a thin jewelers flat blade screw driver.

Use contact cleaner applied to a piece of bond paper, slide paper between contacts until the paper no longer turns black.

Use canned air to remove excessive contact cleaner and any debris remaining after cleaning. Install plastic cover, plug relay into it's socket, and check for proper operation.

From: Noodle10536
Topic: 23553 Message: 23590

FWIW, I have a 130' wire dipole fed with 450 ohm ladder line all the way into my shack that then connects to a Johnson Viking Matchbox. I have an A - B switch with the A side connected to the Matchbox (antenna) and the B side connected into a dummy load. I tune my TS-830s into the dummy load and then switch back over to the antenna and tune the match box. It works well for me, a novice, and I get consistently good audio reports. I also have a small yard and used two trees to support the antenna. It is up about 25' in the front and then the ground slopes off and it is about 50' in the rear. Mine is a straight run and is fixed at one end and has a sailboat pulley, rope and sash weights at the floating end. Good luck, Peter KC2RBX

Your welcome, that's what the group is here for !! For future reference though sandpaper is not really a good choice as it can actually damage the contacts by removing part of the surface material and then the contacts cannot mate together for a good connection. Use a good contact cleaner like Deoxit 5 and then take a business card or a dollar bill "a $20 if you have one these days " and slide it through the contacts a few times while they are closed.

23592. Power Transformer wireing to Rectifier board TS-820s

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-24 03:46:35 UTC
From: trippkj4bkd
Topic: 23592 Message: 23592

Hello,

I have recently rebuilt my rectifier baord and I know I should have taken pictures of the wireing before I unsoldered things. I did make a quick sketch but there is one part that I did not draw very accurat.

The 800v from the PWR TX to the rectifier board goes to the corner pin marked 800v on the rectifier board? The 800v from the HV board goes to the second 800v pin marked 800v on the rectifier board as well as the red wire from the high voltage cap also going to the second pin marked 800v on the rectifier board? At least thats what it appears to me looking at the wireing schematic. Please advise.

Tripp

From: w5rkl
Topic: 23592 Message: 23594

The TS-820/820S power transformer's high voltage secondary winding has 3 terminals:

800 - connects to the Rectifier Unit board's "AC800" terminal

400 - not conneted

0 - connects to the junction of C21 (positive terminal) and C22 (negative terminal)

The 820's high resolution schematic shows this. The service manual schematic, when zoomed into, is blurry but the 820 hi-res schematic is clear.

Its good to have the radio working again, isn't it? You need to remember this URL: www.k4eaa.com as that is where you can get a new relay. Yours will probably not last if you sanded the contacts because the sandpaper cuts through the thin plating on the contacts and they corrode rapidly.

Thanks; I just BARELY touched the contacts with the sandpaper, only moving it a couple of inches, for 2 or 3 strokes. I could not see any marks or discoloration on the sandpaper when I finished. Hopefully I did not remove any metal, but time will tell I guess. So far, so good!
Thanks again!!

Thank you; I have his website bookmarked, and contacted him before, I found and fixed the relay, with this groups assistance.
I used the sandpaper VERY LIGHTLY, with just 2 or 3 strokes of about an inch each stroke. Then I cleaned it with DeOxit and compressed air. I'll have to see how long it lasts, but I can't imagine I removed any real amount of metal. The sandpaper showed no markings or color on it. Hopefully I used it light enough to just remove the carbon.
Thanks again 73 de K5LCL

Its good to have the radio working again, isn't it? You need to remember this URL: www.k4eaa.com as that is where you can get a new relay. Yours will probably not last if you sanded the contacts because the sandpaper cuts through the thin plating on the contacts and they corrode rapidly.

Eureka!!!

I would have never found the relay without your description! I pulled it out, and ran some VERY fine sandpaper LIGHTLY across the contacts, then sprayed it with DeOxit, and used compressed air to blow it dry. I put it all back together and it is working like a charm right now. I'll have to see how long it lasts, but so far, it is fixed.

Thank you for all the help!!

RL1 and it is somewhat hidden under a small metal cover. With the bottom cover off and with the back of the 820 facing you look to the rigt rear corner (close to where the antenna SO239 is mounted) and you will see under the metal cover. You will have to remove the screws holding the cover in place to gain access to the relay to pull it out of the socket.

Sounds like the relay contacts, try cleaning them. The receive signal passes through a set of NC (normally closed) relay contacts which open when you key up then close on key down so if they are dirty or corroded or pitted you would get these symptoms.

Any ideas on what would make the TS-820 volume drop on receive intermittently? It seems to happen more often just after I finish transmitting, but it will do it while just receiving also.
It's not the volume reduction associated with propagation, (I can tell the difference), but something internal to the radio. The volume will drop to about 1/2 level, then just come back up to normal for no apparent reason.

Oh!! That makes sense! Then the arc leads to carbon buildup, which causes the problem to re-appear. Oh well, I guess I can always order a new relay, now that I know it WAS the problem, once it starts causing me problems again.
Thank!

23603. Weak Driver Tube on my TS-520?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-24 23:50:14 UTC
From: dllewiszz
Topic: 23603 Message: 23603

Hi,

This is long. Please bear with me.

After far too many years of inactivity, I picked up a TS-520 on eBay so I could get back on the air in a frugal way. The rig I purchased didn't have a mic with it (that's pertinent later).

When it arrived, it wouldn't transmit at all. The idle current of 60ma was normal, but there was no ALC indication and no output in any mode at the SO-239. On a shortwave receiver sitting next to the TS-520, I could hear the carrier being generated on the correct VFO freq, so I figured the oscillator was doing its thing. The TS-520 receiver was working fine, and I opened it up to clean all the scratchy wafer switches and to check that the tubes were seated firmly. Still no xmit. After reading the doc here about how to do a quick check on the finals, I followed the instructions and increased the bias/idle current substantially for 2 or 3 seconds, returning it quickly to 60ma. Voila! She started transmitting! The rig tuned normally, so I plugged a key in and even worked a little CW. What did I jumpstart?

When tuning, or keying CW, I saw plate current at around 220 - 240ma, HV in the 800 ☐ 900v range, and an RF reading about 2/3 across the meter scale. I also now noticed ALC in the normal range when the Carrier control was a little past the mid-point on 40 meters, but on 20 meters I hardly saw any ALC at all, although the rig was indeed transmitting with normal plate current. I no longer own a good dummy load, so I'm transmitting into a plain center-fed 40/20 fan dipole that has a surprisingly low SWR on both bands.

I found an MC-50 mic on eBay, and when it arrived I was surprised at what I found. But this may help determine if there's a real problem here. I was surprised that I have to crank the mic gain up pretty high to get any RF output when I speak ☐ even at 3 inches from the mic. Unless I crank it to 3 o'clock, I get very, very little meter movement (RF, or IP, or ALC). The ALC meter action seems a little unusual, in that it requires a pretty strong audio level to make it move, and then it jumps past the normal ALC range rather quickly. That's on 40m. On 20m, I see no ALC ☐ or just a tiny bit of movement when I drive it hard, but again, the rig is indeed transmitting on both bands. I worked plenty of guys last weekend during the contest, and the audio reports are good, though I don't know if it sounds as good as this mic/rig combination usually sounds. When I drive the mic at 3 o'clock and talk pretty close, the RF reading is about like I'd expect, peaking around one-third to mid-scale, which is of course less than the reading seen with a dead carrier in CW mode.

Of course, there's always the possibility the mic is defective. I can't be 100% certain, but I tried this: Killing the SG switch, I can listen to my very weak signal on the co-located shortwave receiver ☐ and I can hear my audio with the mic gain very low, say, around 8 or 9 o'clock. That makes me think the mic is OK.

So the question is whether I have a weak driver tube causing this, or is there something else I need to check? With the finals reading the way they do, I tend to think they're OK.

Thanks for reading this far and offering suggestions on next steps.

73,

Dave WA4FXT

I RESPECTFULLY DEMAND THIS MESSAGE BE POSTED IN MY DEFENCE!!
IF I CAN BE ACCUSED ALL OVER THIS GROUP, THEN I SHOULD BE ALLOWED TO DEFEND MYSELF TO THE ENTIRE GROUP!
MY NAME IS DR.FRED WEKSBERG. I AM THE ACCUSED!! My call is VE3PIE and I live in Thornhill. I am a very well known dermatologist in the city of Toronto and am connected with North York General Hospital. I went through messages tonight only to find my name plastered everywhere as a thief, and have been reported to the RCMP!! With respect to Robert from whom I purchased the equipment you should be ashamed of yourself! How disgusting your behavior. When I paid the amount to paypal you sent me a message that you gave me the wrong paypal account. You said that I would get a refund and I should pay the new correct paypal account. I did this without question or reservation! Those transactions caused paypal to take over $2000 out of my bank account, and I have currently paid twice for the equipment. I NEVER GOT ANY REFUND. I called paypal and they explained that I could claim back the erroneous second payment in about 6 business days. I was OK with that. I did not accuse Robert VE7BDO of trying to defraud me out of a double charge. It was an error in the billing system. I currently am out $2000, double the agreed purchase amount. AND I AM BEING ACCUSED OF FRAUD??? AT NO TIME DID ROBERT VE7BDO OR ANYONE ELSE ASK ME OR CONFRONT ME ABOUT THEFT SUSPICIONS! PLEASE GO TO MY PHYSICIAN WEBSITE www.drweksberg.com , look at my picture and call me a thief??? This is absolutely disgusting!!!!!!!!!!!!!!!!!!!!!!
VE7BDO Robert has yet to apologize to me- and he has $2000. I DEMAND AN APOLOGY FROM EVERYONE WHO ACCUSED ME!! DON'T CALL YOURSELF "HAM RADIO OPERATORS" THAT DEFINITION IS FAR ABOVE YOU!! I AM SO ANGRY AS I TYPE THIS I MAY BREAK THE KEYBOARD!!
I APOLOGIZE TO THE REST OF THE GROUP THAT HAS TO BE SUBJECT TO THIS "CR.P". BUT I AM ENTITLED TO DEFEND MYSELF IN THE SAME VENUE AS I WAS ACCUSED. PERHAPS WHOEVER REPORTED ME TO THE AUTHORITIES COULD CANCEL THE CLAIM - IT WOULD BE THE PROPER THING TO DO!
SINCERELY YOURS,
FRED WEKSBERG, MD, FRCP(C),FACP

Ok, thanks Mike, but just to be clear.
The 800v from pwr tx goes to AC800v on rectifier board.

The 800 marked on HV board goes to 800v on rectifier board.Not AC800v

The Red wire from the positive of C22 high voltage cap also goes to 800v of recitifer board.Not AC800v

The 0 on the pwr tx is wired the way you have stated.

From: dennis hatch
Topic: 23603 Message: 23607

Check the MC-50 and make sure it's set to HI Z position. That will cause low mic sensitivity some what..... If your getting good ALC on CW, you should have good ALC on SSB if the side band stages are working properly.

Subject: [TS-520_820_530_830] Weak Driver Tube on my TS-520?
To: TS-520_820_530_830@yahoogroups.com
Date: Tuesday, November 24, 2009, 5:50 PM

Hi,

This is long. Please bear with me.

After far too many years of inactivity, I picked up a TS-520 on eBay so I could get back on the air in a frugal way. The rig I purchased didn't have a mic with it (that's pertinent later).

When it arrived, it wouldn't transmit at all. The idle current of 60ma was normal, but there was no ALC indication and no output in any mode at the SO-239. On a shortwave receiver sitting next to the TS-520, I could hear the carrier being generated on the correct VFO freq, so I figured the oscillator was doing its thing. The TS-520 receiver was working fine, and I opened it up to clean all the scratchy wafer switches and to check that the tubes were seated firmly. Still no xmit. After reading the doc here about how to do a quick check on the finals, I followed the instructions and increased the bias/idle current substantially for 2 or 3 seconds, returning it quickly to 60ma. Voila! She started transmitting! The rig tuned normally, so I plugged a key in and even worked a little CW. What did I jumpstart?

When tuning, or keying CW, I saw plate current at around 220 - 240ma, HV in the 800 – 900v range, and an RF reading about 2/3 across the meter scale. I also now noticed ALC in the normal range when the Carrier control was a little past the mid-point on 40 meters, but on 20 meters I hardly saw any ALC at all, although the rig was indeed transmitting with normal plate current. I no longer own a good dummy load, so I'm transmitting into a plain center-fed 40/20 fan dipole that has a surprisingly low SWR on both bands.

I found an MC-50 mic on eBay, and when it arrived I was surprised at what I found. But this may help determine if there's a real problem here. I was surprised that I have to crank the mic gain up pretty high to get any RF output when I speak – even at 3 inches from the mic. Unless I crank it to 3 o'clock, I get very, very little meter movement (RF, or IP, or ALC). The ALC meter action seems a little unusual, in that it requires a pretty strong audio level to make it move, and then it jumps past the normal ALC range rather quickly. That's on 40m. On 20m, I see no ALC – or just a tiny bit of movement when I drive it hard, but again, the rig is indeed transmitting on both bands. I worked plenty of guys last weekend during the contest, and the audio reports are good, though I don't know if it sounds as good as this mic/rig combination usually sounds. When I drive the mic at 3

o'clock and talk pretty close, the RF reading is about like I'd
expect, peaking around one-third to mid-scale, which is of course less than the reading seen with a dead carrier in CW mode.

Of course, there's always the possibility the mic is defective. I can't be 100% certain, but I tried this: Killing the SG switch, I can listen to my very weak signal on the co-located shortwave receiver – and I can hear my audio with the mic gain very low, say, around 8 or 9 o'clock. That makes me think the mic is OK.

So the question is whether I have a weak driver tube causing this, or is there something else I need to check? With the finals reading the way they do, I tend to think they're OK.

Thanks for reading this far and offering suggestions on next steps.

73,

Dave WA4FXT

Yes, It is a private Matter, but I let Fred have a chance to post his side. I will leave his post for a couple of days and then Remove it as well as the Original post.
I set a poor precedence when I posted about a fellow here that I have a problem with. I was wrong to post it to the group, but I wasn't wrong in my assessment of the situation.
In the future, let's try to keep the posts about the Kenwood radios.
Hope everyone has a Happy Thanksgiving.

John...

Your website looks good and thanks for putting it all up for download. Be advised that the VFO-520 link actually accesses a
VFO-230 manual though.

I use an MC-60A on my TS-520SE. It works and sounds very good according to reports I get on my audio. It’s a fairly good match as long as you set it to 50K ohms. I run the mic gain without the processor at around 10am, a little lower with the processor.

I use an MC-60A on my TS-520SE. It works and sounds very good according to reports I get on my audio. It’s a fairly good match as long as you set it to 50K ohms. I run the mic gain without the processor at around 10am, a little lower with the processor.

Greg

From: w5rkl
Topic: 23410 Message: 23619

I agree with Ken. If C7 is shorted internally, the HV will be present at the junction of C7 and L3.

There are other components that can result in a DC voltage being present on the PI Network but that would require more than one DC blocking capacitor to short internally and I seriously doubt that happened.

Are you sure the PLATE (VC1) variable capacitor plates are grinding or is it the LOAD variable capacitor (VC2-1/2/3) that is making the grinding/scrapping noise?

Connect a DC volt meter to the junction of C7 and L3. If the meter indicates a DC voltage then most likely C7 is shorted internally, especially if the voltage is approximately 900VDC in receive.

Do not place the 830 in transmit when measuring the voltage at the junction of C7 and L3.

One more thing, if there is 900VDC at the junction of C7 and L3, more than likely RF choke L5 (470uh choke) might possibly be burnt "Open".

From: Dick Merryman
Topic: 23612 Message: 23620

Marty-

About a month ago I gave $500 for a TS-830S gold. Included was a VFO-230, a SP-230 and a no-name hand mike. I felt that I got an extremely good deal as TS-830Ss by themselves generally run between $400 - $500. That said, I jumped on the deal after it was on both QRZ and QTH for several days and so if it was that great of a deal I would expect that it would be gone sooner.

So, what is a TS-830S gold worth? Who knows. Whatever the buyer is willing to pay. I was willing to pay $500 for the radio alone and still would if I was still looking. That's all the help I can offer except for the following:

You should know that the TS-830S gold label came from the factory with the two optional CW filters installed. Many, many gold's have had the two filters removed and sold separately so they are not really gold's anymore except for the little label. There is no other difference between a gold and not-gold label. The filters will cost around $140 used and one of them is rare. New Inrad filters are way higher than that. If the CW filters are not important to you then I would expect you might pick up a TS-830S for $400 or less. Not more.

Using the VBT (variable bandwidth tuning) control, the optional filters permit you to squeeze the CW band width down so tight that a ray of light wouldn't slide through. It may be useful to some but to me the VBT without the optional filters works just fine. When you squeeze the bandwidth too much there is a lot of ringing and for me it is hard to copy CW.

OK, where does that leave us? Well, as far as I am concerned the TS-830S is a fine, fine box with or without the filters. I get about 130 watts out on all bands and the receiver is superb. I highly recommend buying one if you are so inclined.

Check out QRZ because I think I remember seeing a fixer-upper on there in the past two weeks or so. As I recall the problem was the digital display was flakey but the rest of the radio worked FB. The digital displays are easy to fix if you are at all technical and it may be that all it needs is a good cleaning. I can't remember the price but I do remember that I considered buying it but didn't as I already have three radios and just can't justify another.

Good luck,

-Dick-

Bingo! The mic was in LO-Z and now that I've changed it, the sensitivity seems pretty normal. ALC seems to drop slowly on CW, so I still may have a weak driver, but this certainly clears up the mic question. Thanks!!

23622. TS-520SE with external VFO question

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-25 23:32:49 UTC
From: Peter
Topic: 23622 Message: 23622

Hi All. I have a TS-520SE with the external VFO attached. Today when I was having a QSO I experienced constant drifting fro the original frequency. I hadn't noticed this when I was just listening, only when I started the QSO. Is the external VFO the issue or is there something else that I need to do? Thanks in advance for ant advice that you have.

73,

Pete, N1TCH

Hi Joe,

What you need is a two pin CB power plug. Very popular in the UK and
Australia. Here's a google search that should help you.

http://www.google.com/search?num=50&hl=en&newwindow=1&safe=off&as_qdr=all&q=cb+power+lead+%222+pin%22&btnG=Search&meta

You could also ask Neil at AADE here.

23625. Re: TS-520SE with external VFO question

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-26 12:05:21 UTC
From: w5rkl
Topic: 23622 Message: 23625

Hello Pete,

The drift in your 520SE is caused by instability in the 9VDC supply on the FIX CH AVR UNIT board by aging Q4 and D3.

Drift occurs when the 9VDC supply is not held at a constant 9VDC +/- .5VDC. When Q4 and D3 ages the 9VDC becomes unstable resulting in a drifting 9VDC. When the 9VDC is not stable the 520SE drifts in both transmit and receive.

Replacement of Q4 and D3 will significantly reduce the drift of the 9VDC supply resulting in a much more stable TS-520SE.

The drift in the 520SE cannot be completely eliminated. There always will be some drift, a few hertz or so. But the key to reduction in the amount of drift is the stability in the 9VDC supply and not because you have an external VFO connected to the 520SE. While it is true the external VFO, when used, results in an additional load on the 9VDC supply, the external VFO is not the source of the drift in the 520SE, it's the instability in the 9VDC supply on the FIX CH AVR UNIT board that is causing the drift. The 9VDC supply, as designed, is more than capable of providing a stable 9VDC supply to provide power to all the circuits both internal and external to the 520SE. Therefore, replace Q4 and D3 and the 9VDC supply will become much more stable leading to a significant reduction in the 520SE's drift in both transmit and receive.

23626. Re: Weak Driver Tube on my TS-520?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-26 12:38:00 UTC
From: w5rkl
Topic: 23603 Message: 23626

Dave,

ALC is not used in CW mode, therefore, there will be no ALC meter indication in CW mode regardless of the CAR control setting.

A falling ALC meter indication after peaking the DRIVE control in TUNE mode is a sign of a weak driver tube.

The ALC meter indication "will" drop significantly when the PLATE control is adjusted for a "dip" in "IP" current while in TUNE mode. This is normal and should not be misinterpreted as a weak driver tube.

I agree, a low impedance microphone will produce low indication on RF and IP meter indications plus there will be little, if any ALC meter readings.

ALC is produces when grid current flows in the final tubes. Grid current flow when the level of RF driving signal results in the final tube grid's positive peak swing in grid voltage becomes positive. The moment the swing in grid voltage to the final amplifiers becomes positive, a current begins to flow between the final tube's cathode and grid, hence "grid current". This positive swing in final tube grid voltage is sensed by the emitter of Q10 on the RF unit which results in an identical change in collector voltage of Q10 resulting in an ALC voltage appearing on the RF UNIT's "ALC" terminal. The ALC voltage is then fed to the "AGL" terminal on the GENERATOR UNIT to control the gain of Q1 and to the same "AGL" terminal on the IF UNIT to control the gain of Q1 which leads to an overall reduction in RF output.

ALC is in TUNE mode is used entirely as an "tuning aid", nothing more.

RF output gain in CW is controlled primarily by varying a DC voltage to the GENERATOR UNIT's applied to the balance modulator through the CAR control.

RF output gain in sideband is controlled by both the MIC gain and the ALC voltage applied as indicated above.

For further details about grid current in amplifier class see the ARRL handbook.

Hello all! I'm hoping someone can help me!
I have recently purchased a TS-820s and upon hooking it up I have discovered that only the CW mode seems to transmit. The Usb and Lsb modes seem to be dead ☐ no output at all.
When the mic is keyed I here a relay click but my AT-230 shows no power output at all.
Could I have missed something?? Where might I start to troubleshoot??
Any help would be greatly appreciated!!

> Drift occurs when the 9VDC supply is not held at a constant 9VDC +/- .5VDC. When Q4 and D3 ages the 9VDC becomes unstable resulting in a drifting 9VDC. When the 9VDC is not stable the 520SE drifts in both transmit and receive.
>
> Replacement of Q4 and D3 will significantly reduce the drift of the 9VDC supply resulting in a much more stable TS-520SE.
>
> The drift in the 520SE cannot be completely eliminated. There always will be some drift, a few hertz or so. But the key to reduction in the amount of drift is the stability in the 9VDC supply and not because you have an external VFO connected to the 520SE. While it is true the external VFO, when used, results in an additional load on the 9VDC supply, the external VFO is not the source of the drift in the 520SE, it's the instability in the 9VDC supply on the FIX CH AVR UNIT board that is causing the drift. The 9VDC supply, as designed, is more than capable of providing a stable 9VDC supply to provide power to all the circuits both internal and external to the 520SE. Therefore, replace Q4 and D3 and the 9VDC supply will become much more stable leading to a significant reduction in the 520SE's drift in both transmit and receive.

There will be no SSB output unless audio is coming from the mic. Several things to check such as: were you trying to talk into the mic and/or the mic gain turned down? Could be any number of things with it working in CW and not SSB. These two are easy to overlook if new to HF SSB. The group needs more info to start drawing ideas for solving your problem.

Hello all! I'm hoping someone can help me!
I have recently purchased a TS-820s and upon hooking it up I have discovered that only the CW mode seems to transmit. The Usb and Lsb modes seem to be dead – no output at all.
When the mic is keyed I here a relay click but my AT-230 shows no power output at all.
Could I have missed something?? Where might I start to troubleshoot? ?
Any help would be greatly appreciated! !

23634. Re: Weak Driver Tube on my TS-520?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-26 17:24:54 UTC
From: dllewiszz
Topic: 23603 Message: 23634

Thanks, Mike. That's helpful, and clears some of my confusion. When I'm in TUNE mode, I still see very low or now ALC on 20m, but otherwise things look pretty good. It's been awfully long since I studied vacuum tube amp classes, so the reminder on grid current and the ALC feedback system was welcome. All this IP stuff I've been buried in for the last 15 years has erased a lot of what I knew as a teen.

Mike, I'm pretty sure I heard you either Tues or Wed in a QSO with a station in NC on 40m.

73,

Dave

>
> I agree, a low impedance microphone will produce low indication on RF and IP meter indications plus there will be little, if any ALC meter readings.
>
> ALC is produces when grid current flows in the final tubes. Grid current flow when the level of RF driving signal results in the final tube grid's positive peak swing in grid voltage becomes positive. The moment the swing in grid voltage to the final amplifiers becomes positive, a current begins to flow between the final tube's cathode and grid, hence "grid current". This positive swing in final tube grid voltage is sensed by the emitter of Q10 on the RF unit which results in an identical change in collector voltage of Q10 resulting in an ALC voltage appearing on the RF UNIT's "ALC" terminal. The ALC voltage is then fed to the "AGL" terminal on the GENERATOR UNIT to control the gain of Q1 and to the same "AGL" terminal on the IF UNIT to control the gain of Q1 which leads to an overall reduction in RF output.

> > >
> > > When it arrived, it wouldn't transmit at all.Â The idle current of 60ma was normal, but there was no ALC indication and no output in any mode at the SO-239.Â On a shortwave receiver sitting next to the TS-520, I could hear the carrier being generated on the correct VFO freq, so I figured the oscillator was doing its thing.Â The TS-520 receiver was working fine, and I opened it up to clean all the scratchy wafer switches and to check that the tubes were seated firmly.Â Still no xmit.Â After reading the doc here about how to do a quick check on the finals, I followed the instructions and increased the bias/idle current substantially for 2 or 3 seconds, returning it quickly to 60ma.Â Voila!Â She started transmitting!Â The rig tuned normally, so I plugged a key in and even worked a little CW.Â What did I jumpstart?
> > >
> > > When tuning, or keying CW, I saw plate current at around 220 - 240ma, HV in the 800 â□" 900v range, and an RF reading about 2/3 across the meter scale.Â I also now noticed ALC in the normal range when the Carrier control

was a little past the mid-point on 40 meters, but on 20 meters I hardly saw any ALC at all, although the rig was indeed transmitting with normal plate current.Â I no longer own a good dummy load, so I'm transmitting into a plain center-fed 40/20 fan dipole that has a surprisingly low SWR on both bands.
> > >
> > > I found an MC-50 mic on eBay, and when it arrived I was surprised at what I found.Â But this may help determine if there's a real problem here.Â I was surprised that I have to crank the mic gain up pretty high to get any RF output when I speak â□" even at 3 inches from the mic.Â Unless I crank it to 3 o'clock, I get very, very little meter movement (RF, or IP, or ALC).Â The ALC meter action seems a little unusual, in that it requires a pretty strong audio level to make it move, and then it jumps past the normal ALC range rather quickly.Â That's on 40m.Â On 20m, I see no ALC â□" or just a tiny bit of movement when I drive it hard, but again, the rig is indeed transmitting on both bands.Â I worked plenty of guys last weekend during the contest, and the audio reports are good, though I don't know if it sounds as good as this mic/rig combination usually sounds.Â When I drive the mic at 3 o'clock and talk pretty close, the RF reading is about like I'd
> > > expect, peaking around one-third to mid-scale, which is of course less than the reading seen with a dead carrier in CW mode.
> > >
> > > Of course, there's always the possibility the mic is defective.Â I can't be 100% certain, but I tried this:Â Killing the SG switch, I can listen to my very weak signal on the co-located shortwave receiver â□" and I can hear my audio with the mic gain very low, say, around 8 or 9 o'clock.Â That makes me think the mic is OK.Â
> > >
> > > So the question is whether I have a weak driver tube causing this, or is there something else I need to check?Â With the finals reading the way they do, I tend to think they're OK.Â

23635. Thinking of selling TS-520SE, need input

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-26 17:36:00 UTC
From: James Allen
Topic: 23635 Message: 23635

Hi all. Things aren't going so well and I am thinking that in order to provide my family with a good christmas I will need to sell my TS-520SE. I need some input on an asking price. It is in excellent cosmetic condition and I tested it into a dummy load on all bands and I can get 100+ watts out. It is very clean inside and did not come from a smoking home. I also have the MC-50 in excellent condition as well as the SP-520 in excellent condition. How much should I ask for when listing this combo for sale? I am planning on listing it locally first so that I do not have to mess with shipping it, unless someone on here really wants to buy it. I've looked at ebay and seen a 520SE go for nearly $400 in good condition, the mike go for anywhere from $50 to over $100, and the speaker go for about $45 lately.

I'm bummed about having to sell it since it is my first HF radio, but my family needs to come first and I know I can always buy another rig next year when I have a better job (I recently graduated with my B.S. in business administration so I'm still trying to find something to use it with). I appreciate any help you guys can give me.

Sure would Pete. Be careful when removing the capacitors, not to apply too much heat to the capacitor leads. Heat can radiate along the PC foils and affect other components.

That's strange because the spacing between the fixed and variable plates in the PLATE cap are much wider than the LOADING capacitor. Sounds like a previous owner abused the final stage or didn't pay attention to what they were doing and bent one or more of the plates.

Have you checked the interstage coupling cap C7 to see if it's shorted? It may not appear shorted with an ohm meter but applying high voltage C7 may short.

23640. TS830S Burghardt Repairs - ongoing

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-26 22:24:33 UTC
From: jwarnerr
Topic: 23640 Message: 23640

I previously reported my ts830s had 60ma bias and 850-900v HV but would not load, after a 10 year hiatus in storage. Nothing suggested here helped so the radio was shipped to Burghardt for repairs - and is back and tried.

Burghardt traced the problem to electrolytics gone bad and mentioned the radio was 'badly' out of alignment. The alignment is was new to me because prior to the shipping the digital display was spot-on in receive. The radio is back and was tried today, to the following very disappointing results!

The radio will put out only about 60-70 watts max and the digital display is OFF by about 8kc (low). This after nearly $500 expended in shipping and repairs. Im extremely disappointed.

The fact of the digital display being suddenly off puzzles me because the radio was spot-on prior to sending to Burghardt. But, when I tune to WWV (10mhz) or calibrate (25kc)the dig display is spot-on. Then when I go to find a dxer (posted on the cluster) the radio's display is low by almost 8kc, in every band. Is there any quick way to realign my digital display ? How can it be spot-on at WWV and in Calibrate but off when I go to find a dx station? Could any of this be due to Burghardt's "re-alignment" Jim Smith says Burghardt did?

And what accounts for my only having 60-70 watts output after spending $450 with Burghardt!?

Im rather put out at this whole situation -

kg0ei

before discussing here, did you ask Burghardt, and did they say anything to
answer your questions.....

are you measure=inginto a dummy load, how did you find 8kc out on receive.
who says the other stations are not all off by 8kc

I have not talked to Burghardt yet. Will tomorrow or asap. Its
Thanksgiving?

Yes. I measured into a dummy load. I have several very accurate watt/swr meters and an
antenna of known traits on 40 meters. SWR of my ant
at 7025 is 1:1.2

who says my receiver is off? I do. Are you claiming that every one
posting to the cluster is off by 8-7 kc? Are you claiming my other radios receive at 7025
but my ts830 fresh from Burghardt receives
at 7024.2 so not only is everyone at the cluster wrong but all of my
other radios (long used/well known traits) are wrong ... all to save
Burghardt reputation? That OM is a wild claim if that is what you
are driving at.

Im sorry to be short but Im a bit upset and justfiably so.

The difference between 7025 KHz and 7024.2 KHz is 0.8 KHz not 8 KHz. Maybe your problem is not so bad after all. Is your RIT turned off?

I do have a 2 year old, but I talked with my wife after sending out the
e-mail. She was surpisingly understanding and actually does not want me to
sell the radio because I got a really good deal on it ($100 for the radio,
mic, and speaker in working condition). So I will not have to consider
selling it anymore thankfully.

Why did they charge you $500.00 to retune your rig and replace the caps? Those caps are not that expensive! They owe you a tune up and to make your rig like it was new. I hate that when i send a radio to someone and it comes back working worse than it was when i sent it out!

I have the itemised bill but dont think its appropriate to
share it here until I talk to Burghardt, but now Im in a mess
I did not need.

I dont even know what "realignment" they did but whatever they
did the receive digital display is now off more than is
acceptable. (Wouldnt they check this while realigning?)

Wouldnt they check the power output?

But, included in my box was a bill and parts for another guy!
A David Mansoir AC6CG for repairs on his FT-767GX, which has
nothing to do with me.

Hopfully I can get somebody at Burghardt tomorrow and save
myself. Hopfully Mr. Mansoir got his radio back ok...

Wanted to pass along this info from the ARRL:

The ARRL Letter, Vol 28, No 11 (Friday, March 20, 2009)

* Burghardt to No Longer Sell Amateur Radio Equipment: On March 16, Jim Smith, W0MJY, owner of Burghardt Amateur Center in Watertown, South Dakota <http://www.burghardt-amateur.com/>, announced that the company will no longer sell Amateur Radio transceivers and accessories. The company, now called Burghardt Radio Repair, has canceled all backorders. In an e-mail, Smith blamed the current economic conditions for the change that forced the company "to re-evaluate our goals and direction. We will continue to provide radio repair service as it has become a very busy business. Our technicians are very experienced and parts inventories are good. Thank you for your support in the past and we look forward to continuing our relationships through our servicing facility." Jim Smith's son, Mike Smith, KC0FTM, told the ARRL that even though the company has had to lay off employees in the past couple of months, "Burghardt will concentrate on service, just like we have been doing since 1973." Burghardt was founded in 1937 by Stan Burghardt, W0IT (SK), as Burghardt Radio Supply. He sold the company to Smith in 1982, remaining active in the company until January 2002. Burghardt passed away in 2004 at the age of 93.

I repair and Align these radios on a Regular Basis.
I would LOVE to see an Itemized bill that came to $500.00
I did buy a TS-520 from a fellow that had sent it to Burghardt for
repairs.
They sent it back to him as "Unrepairable"
I checked it out and found that there was a broken wire inside the VFO.
Fixed the wire, aligned the radio and it has worked Great ever since.
I had about 2 hours of time in repairing it.
$500.00 for just a repair and alignment is totally out of line in my
opinion.
Please keep us all updated.

I repair and Align these radios on a Regular Basis.
I would LOVE to see an Itemized bill that came to $500.00
I did buy a TS-520 from a fellow that had sent it to Burghardt for
repairs.
They sent it back to him as "Unrepairable"
I checked it out and found that there was a broken wire inside the VFO.
Fixed the wire, aligned the radio and it has worked Great ever since.
I had about 2 hours of time in repairing it.
$500.00 for just a repair and alignment is totally out of line in my
opinion.
Please keep us all updated.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-27 10:41:17 UTC
From: jwarnerr
Topic: 23640 Message: 23655

Ok. The parts section of the bill is as follows:
1 - KP000036 coupler 12.00
2 - KP000020 150UF 500V 18.97@ 37.94
2 - RE000022 470k 1/2w .99@ 1.98

everything else is shipping and labor. It looks like 5 hours
labor at $75 per hour. Total 478.98 and it cost me $52.00 to
ship the radio to them. Total $538.98.

I never even approved the work. I got an email at home in the
evening from Smith saying to call him. I assumed he had an estimate so called him
firstthing the next morning and he reported "the work
is already done". When I heard the bill I flipped but paid it.

Yes. Easily. They go for $300-$350 in clean working condx
around here. That is why I didnt approve the work ahead of
time until an estimate, and then when Smith emailed and I
called the next day to get what I assumed was his estimate,
he said the work was already done.

What did they do for five hours at $75/hour that winds up
with a radio like this? Two caps and two resistors at the caps
and coupler dont add up to five hours? It must have been the
realignment they said needed to be done? I just dont know.

Believe me it had nothing to do with love (on my part).
I wanted the radio repaired but not like this! The xmit
side still doesnt work and now the receive side is out of
alignment which is brand new.All in work I didnt even approve!

I hate to keep posting abt this but back to my original question:
If I wind up with this radio and its 60-70watts output on 40 mtrs,
is there anything I can do to get the digital display on the receive side back in
alignment? Or is this something only a tech can do that has implication for transmit
alignment, and who knows what else?

I am astounded this radio comes back to me with the receive side
now out of alignment because as God is my witness the receive side
WAS NOT out of alignment prior to Burghart's work. I had had the
radio out and been copying with it prior to sending it to 'B' and
the receive side digital display was spot-on (and always had been.

Thanks for any technical help -
Jerry

WOW.....
The Coupler price is fair.
The Caps, They Gouged you on. I can buy those Caps from Digi-Parts for
LESS then half that.
The Resistors are a bit high, but still not going to break the Bank.
The Labor..... OUCH!!!
Not giving you an estimate first... Criminal. (and probably is Illegal)

73,
Gordon

Hi

replacing the two electrolytics in the PSU can be a bit expensive if
purchasing from the US,, postage etc, and takes time due to the postal
delivery time. In the UK , probably the rest of the world, similar caps
are available from Farnell made by Panasonic. Slightly smaller diameter,
but easily packed with a strip of 1.5 mm teflon around the cap inside
of the mounting clamp.
One thing I noticed is that when the caps are in place you can not see
the black strip that marks the negative terminal from the component
side of the chassis.
BEWARE when the solder lugs on the capacitors are pressed on to the
internal connections the mark left on one of the terminals is either a
small square or a cross. DON'T assume that this marks the positive
terminal as done by some other capacitor manufacturers, In the packet
of caps I had this was on the negative lug.

--
Best wishes

Richard Bown

From: ah6rr1
Topic: 23640 Message: 23661

It takes about 30 minutes to replace the caps, alignment takes me about 1-2 hours mostly 1 hour. And once it is aligned it will have a output of 110+ watts. I have done in the last month 3 530's and 6 830's all with the same results and I am working on a 520SE now. If they replaced the band swtich coupler it should not have taken more than 20 minutes. I my opinion they didnt use vasoline or even give you a kiss.
Good Luck

The frequencies you posted are only 800HZ different, not 8,000HZ (8KHZ). Could be the cluster posters rounded off the freq or the guy QSY's a bit to readjust for QRM? 8ooHZ is not a long way off. If you have 2 RX's try them both on WWV then both on a HAM band signal to compare the freq's.

Ken - KB7H

Hi. Its possible that they mixed up your repair bill with someone else's. If not, then I have to agree that the labor charges are quite excessive! I have done the alignment on my TS-530S (from the instruction manual) and it took about 30 minutes. The instructions in the TS-830S manual seem very similar. I can believe that the alignment from the service manual would take maybe an hour.

I cannot see the total repair and alignment taking more than 2 to 2.5 hours for an experienced professional. You are correct to talk to Burghardt as soon as possible. I would think that a satisfactory solution would be for them to refund at least half of the billed amount, and for them to offer to correct the problems at no further cost to you (including shipping). That is if you trust them to correct the problems.

The few times that I have had to have any repairs made (to anything), I have made it clear that no actual repairs are to be done without my permission, and that I only accept price QUOTES, not estimates. An estimate give them the option to raise the cost, a quote doesn't.

TTYL.

Well now here in Oklahoma many amateurs have sent their radios in and got them back they were charged for the repair and the problem not fixed, one guy sent in his new TS-2000 and got a bill for $400. and the radio was still not fixed I have been hearing many bad things about Burghardt and was going to send a radio to them to repair and bring up to snuff but have elected to send elsewhere.

23667. K4EAA is a far better place to send your Hybrid for repair than Burghardt

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-27 19:00:48 UTC
From: W0XS
Topic: 23640 Message: 23667

Ken Kemski (ken@...) worked on my TS-830S. He did a lot of work on it and charged far less. I hope he won't mind my sharing what he did to my transceiver. He is the go-to guy for Kenwood Hybrid alignment and repair and does excellent work, plus his web site will help you make your own repairs and he'll sell you the parts you need too. I'd never send a Kenwood Hybrid to anyone else. Ken is the best for those of us who can't do our own alignment and repairs.

Basic Repair/Align Charge $229.00
Replaced HV caps with partial customer supplied kit
Replaced shaft coupler, cleaned & lubricated bandswitch, indexed front & rear sections
Cleaned and lubricated all controls and switches
Burnished, cleaned and lubricated antenna relay
Repaired Noise Blanker switch
Cleaned and lubricated fan motor assembly
Driver and Final tubes test fine, no replacement necessary.
Neutralized final section
Replaced front panel lamps
VFO intermittent/unstable. Disassembled, cleaned wiper, reassembled
Cleaned interior of rig including final cage
Completely aligned Tx and Rx - Unit tests good all bands, all modes.
Reassembled and performed final test - All OK
Additional Charge for time spent on multiple repair problems $35.00

"Allan C" <<mailto:a1mc%40prodigy.net>a1mc@...>

Here's one that has had a good reputation for a long time, however
I have never had a reason to use his services.
<http://www.avvid.com/>http://www.avvid.com/
Do a google search on him for other references ....

Here's another repair person I've heard of, and many satisfied
comments about him It's Ken, K4EAA

Check out his website here:
http://www.k4eaa.com/
Very GOOD explanation of what he does. And how he does it.

After finding these sites, I googled Kenwood Radio Repair. Then I
settled down to read. I was appalled by comments about Kenwood factory
service. I was heartened by some of the other stories I found about
individuals who did repairs. Check it out yourself by googling.
You'll have your eyes opened.

hi,

I got my HV caps on ebay for $21.99
for the pair including bleeder resistors
and the bypass caps.

I bet they must have gotten your repair
mixed up with the other order, crazy for
them to fix it for 5 hours labor.

Hope you get it resolved.

23672. Low output on 13.5 volt DG-5 power plg

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-27 22:38:21 UTC
From: Peter
Topic: 23672 Message: 23672

I purchased a DG-5 which the seller said worked fine. When I plugged it in it failed to power up. Being a trusting sort I am assuming that the seller was truthful and decided to investigate. I found that the output of the power connector is 10.9 to a max of 11.2 after a warmup. I have looked through the owners manual and service manual for any information regarding this and came up empty. Is this voltage too low to power the DG-5? I don't have a power supply that I can use as a substitute for the rig. Any suggestions or can the unit run on low really DOA? Thanks in advance for any suggestions.

Topic: 23640 Message: 23673

I did (the comparison you suggest)just to have a baseline to
judge everything. But I did miss-speak. The RCV dig display is
off by .7 -.8 kc (low), not 7-8kc. Example: 7025 comes in at
~7024.2, 3517 at 3416.2, 1430.2 at 1429.4. Its basically the
same on all bands.

I also did not give the full chronology, which is worse than
first reported. Right out of the box from Burghardt the radio
had basiclaly no ALC and no output, then finally by tweaking
things I got about 15 watts out, maybe 20. With no ALC I suspected
the driver tube was bad so dug into boxes and found what is supposed to be a new 12byz and stuck it in. Now I had about half scale ALC
but was still only able to get between 60-70 watts out (using the same watt meter a Diawa I use with all my other radios. Jim Smith
reports they got 110watts out on 20 meters in their lab. I have no
way to reconcile this.

Jim Smith called and left a message today asking me to call him
but when I called back there is a message they are closed for Thanksgiving. Jim said
somebody here had sent him an email
advising him of my posts here. Jim did say we should be able
to resolve this - I hope so. But I am waaaaaaaaay over budget
in this already.

My experience with Burghart's in the past has been very good
although I have never had them repair a radio until now. I
hope this can be resolved to everyone's satisfaction, if thats
possible.

I frankly think at this point everyone is kind of hostage to
a bad situation. I seriously doubt Jim Smith wanted this to
happen, and I sure didn't. We all have our problems. Again
I am hoping there is an easy fix involved here, including on
the bill -

73 and thanks.

23675. Tubes and Shelf Life

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-27 23:14:15 UTC
From: Gmail - Kevin, Natalia, Stacey & Rochelle
Topic: 23675 Message: 23675

Hi All,

I was luckly (in my opinion) to obtain 2x pair of new (boxed) GE 6146B tubes from a SK's family. Also purchased the AT-230.
Paid NZ$25 pr.
What I would like to know is can/do these tubes degrade over time while sitting in the box not being used?
At this stage I do not need to replace them, they are still putting out over 100w on all bands. Just thought that they were available buy them.

Regards

Kevin, ZL1KFM

Now to get the VFO-230, SM-220 and maybe the speaker.

Hi Jerry,
The fact that Jim called you is a very good sign.
Perhaps there was a major Mix-up at their end.
If Jim resolves this issue, please post the results here on the
Group for all to read the outcome.
It does sound as though they will need to have the radio shipped back to
them to re-do whatever is causing your problems though.

Of course it's best to store the tubes in a cool dry place, but as long
as they hold vacuum, and the pins aren't allowed to get corroded, I
don't think that there is a known limit to how long tubes sitting on a
shelf will last.

I'll probably catch for flak over this one. I had 4 3-500Z's that I hauled around for over 35 years. I bought an amp, missing the tubes because I knew I had them. Paid $200.00 for a Drake L-4B complete, less the tubes. Took a pair out of the boxes, plugged them in, and turned on the amp. Within 15 minutes I was using the amp in the way it is supposed to be done. No break in, or as some would say "burn in" time at all. They have been working daily for over 2 years now.

That's just my opinion. Many will disagree, but that's their problem. I've worked in the industry for well over 50 years, and never worry about taking a tube out, plugging it in, and apply power. Never once did I ever have a problem.

I have a TS-520S, surplus to my needs, that needs several wafers on the final cage bandswitch. Am considering parting it out rather than go to the expense of a replacement switch or wafers plus installation time. I'd rather have a replacement switch but they seem non-existent or made from precious metal if quoted prices are any indication.

what might you need?

That's funny because my TS520 classic needs the same switch wafers. I just leave it on 80 M now and it has it's own 80M dipole connected.

Hello Folks,

Hope all you guys out there in our former Colony had a really good Thanksgiving. My American wife celebrated it too, by travelling to Boston (in UK!), and throwing a symbolic Tea Bag into the Harbor there !! We then sat in our folding chairs, on the dockside, and had a nice cuppa from our flask, before returning home !!

On to serious matters! I have just modified an AT 230 ATU, to have an internal Dummy Load. I have done it with just one 'Specialised' resistor, and now, when you put the switch on the ATU to 'Dummy Load', you get a 200 Watt 50 Ohm non-inductive resistor switched in. I have put all the 'guff' and the pictures on my TS 520 Website, if anyone is interested in doing this modification.

You will find it here ..... Johns Kenwood TS 520 Web Site
<http://www.john4music.tv/>

73's de John

I don't like to see this much flaming on this group, but on the other hand, I can understand why Jerry is upset. Since this is a holiday weekend, let's give this a rest until the middle of next week.

Give Burghardt a chance to get back with Jerry and see what Burghardt has to say.

23686. New Group Co-owner

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-29 12:14:58 UTC
From: N9WB
Topic: 23686 Message: 23686

I asked Gordon, N6WK to help me by being a co-owner of this group. I should have done this a long time ago. Fortunately for all of us he accepted.

Gordon, we appreciate all of the input and help you have given our members for so many years. We appreciate your willingness to continue to help in this expanded capacity and keep this group growing.

23687. 520se transmitting???

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-29 12:11:35 UTC
From: fjwheeler3
Topic: 23687 Message: 23687

hi
I need the wisdom of the group.
I have a :520se into a 20 meter dipole 20ft high .
I followed the tuning procedure in the manual and the one
suggested on the list.
I can hear stations but can't work them
when I transmit the processor is pulled out ,meter onalc and needle moves within the alc markings.
ip is at 70 ma
when talking in mic rf meter reads 50-100
uv reads a solid 300
What I think;
swr is not correct.I bought a meter. on eBay and expect to
test in a few days.
I guessed that dipole cut to length with 40ft rg58 would be close
mic is distorted.
it is an astatic d104 bought at hamfest
It was missing connector so I wired it as per
manual. if alc is in range I must be inputting
something.
I have an old cb mike. can that be used if wired properly?
any help appreciated
Fred

Hello Fred,

Did you make the dipole or was it one of the commercially made mono band dipoles? If you made the dipole and you do not have an SWR meter to adjust the length of each side's wires for the lowest SWR then more than likely a lot of your transmit RF is being reflected back to the transmitter and very little is actually being radiated. You can only determine the SWR level with an SWR meter which appears you have purchased one on eBay.

As far as microphones, the microphone used with the 520 should be a high impedance microphone. Low impedance microphones result in low / muffled audio which leads to low RF output which cannot be fixed by turning up the MIC gain setting.

You did not state whether the D-104 is the amplified or non-amplified D-104. Look at the bottom of the microphone stand, there's a small hole. If you see a screw driver adjustment through the hole then the D-104 is the amplified (T-UG9) base.

A bad microphone element, not uncommon with D-104 microphone, can result in no audio or distorted audio in the transmit signal.

The normal final amplifier no-signal final amplifier idling current is 60ma not 70ma. Set the final amplifier's idling current as shown on page 18 of the 520's operator's manual.

The processor is covered on page 21 of the 520's manual.

There is no requirement for a constant peak ALC meter indication during normal sideband transmit. If this is what is happening then the MIC gain is set too high which will result in distortion in your transmit signal.

Hi Fred. First of all, you need a dummy load to tune up into. If by IP you mean the bias current, it should be 60MA not 70. The RF meter in the radio is NOT measuring watts, it is a relative reading. What do you mean by "uv reads a solid 300"?

First follow the instructions in the manual for setting the bias current. Is the D-104 amplified? Whether it is or not, it may not be wired correctly internally to work with your radio. If it is one of the D-104 mics sold for CB use, it is probably amplified, and low impedance. Your radio requires a high impedance mic. The PTT and mic shield must be separate for it to work correctly. The same goes for pretty much any CB mic. The CB mic is probably a low impedance mic, and your radio requires a high impedance mic.

As stated in the manual, the radio should only be operated into a dummy load, or an antenna with an SWR of 2:1 or less. If you do not have the manual, it can be downloaded from a nimber of places on the internet.

Hi Fred,
Don't know if I qualify as wise, but I have a 520SE that behaves the same way. I am using a MC-50 mike and have an AT-200 tuner. I have my dipole which is cut for 14.300 about 20 feet off the ground as well and on most of the General portion of the band has about a 1.5/1 SWR. I think that it is the low antenna elevation as much as anything that is the issue. I have had a QSO with a Cuban station and a couple of others towards the southeast from my QTH in southern NH - FL, TN and PA. Since I replaced a 6 meter dipole that gave similiar results I'm not surprised. I do believe that getting the dipole up to about 30 feet will help. There was a good article on antenna height in a recent QST.

Hello Joseph,

The voltage adjustments on the 820's AF AVR UNIT board are covered in the 820's service manual starting on page 44.

You can download the 820 service manual from the following website, free:

www.n6wk.com/kenwood/

Scroll down the page and click on the 820 service manual link.

To make the adjustments, remove the power plug from the rear panel and remove both top and bottom covers.

Turn the 820 upside down, front panel facing you, and locate the AF AVR board directly below the VFO.

Note the 2 plug along the AF AVR board that are closest to the front panel, these are labeled AF1 and AF2.

The plug pins are numbered right to left, 1, 2, 3, 4, 5, and 6.

Connect a DC volt meter to AF1 pin 1 or 2.

Reconnect the power cable to the rear and make sure the speaker is connected and power up the 820. Leave the 820 powered up for 30 minutes before making any adjustments.

Note the voltage on AF1 pin 1 or 2. If it is not 9VDC, adjust VR4 located in the middle of the AF AVR board so the meter reads 9VDC +/- .5VDC. Do NOT adjust the large plastic pot, that's the "RIT" voltage pot.

Once you have completed the 9VDC voltage adjustment, move the DC volt meter probe to plug AF2 pin 6. The voltage should be 3.3VDC, +/- .5VDC. If the voltage is not 3.3VDC then adjust VR1, located between plugs AF1 and AF2, for a meter reading of 3.3VDC +/- .5VDC.

This completes the voltage adjustments on the AF AVR board.

One additional comment. The primary source of drift in the 820 is instability in the 9VDC supply which powers the VFO whether internal and/or external. Instability in the 9VDC AF AVR supply affects the stability of the VFOs which causes drift in the 820. Instability in the 9VDC supply is typically caused by D5 (6 volt zener) and regulator Q7 (2SA496Y). Replacing both components will significantly reduce the drift in the 820.

You can obtain both components, D5 and Q7, from the following website.

http://www.electronicsurplus.com/ccp78762-to-220-pnp-transistor-2sa496-y-13844.htm

Any 6.1 volt 1/2 watt zener will work fine as a replacement for D5. The above website sells a 6.1 volt 1 watt zener for 25 cents each, must purchase minimum of 4, which will also work

fine.

http://www.electronicsurplus.com/ccp77886-6-2v-1w-525-do-41-axial-zener-diodes-min-purchase--1n4735a-22930.htm

I have an 820 that had a significant amount of drift after the 30 minute warm up period. I replaced both D5 and Q7 on the AF AVR board and the drift was significantly reduced to factory specifications. If you replace D5 and Q7, you will have to readjust the 9VDC then the 3.3VDC adjustments on the AF AVR board.

I reused the heat sink on Q7. I simply applied some additional silicon grease between the transistor and the heat sink. The heat sink will feel warm to the touch, which is normal, during normal operation.

DR OM Pete. i have worked the world with a 40 meter Carolina Windom on many field days and the antenna only 25 foot up,. I understand the Higher the better but I don't think that is the major problem in making contacts. What time of day are you trying 20 meters? Operating time makes a big difference on most any band. Are you calling CQ or trying to make contacts with a ham just ending his QSO or one calling CQ. Unforthuately for you, allot of hams may not be returning you CQ for various reasons...strength, quality of audio or plain ole just not interested. Listen for a ham that has moderate to strong signal and audio and try going back to him. Tell him your operating conditions and ask how you sound to him, my audio OK? Hows my signal strength? etc. Find out what he is using for antenna and power out, etc. Good luck OM, will be looking for you on 20. 73 Rich K8UV

23698. Use of a Pioneer DPM-31 Mic with TS-830??

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-11-30 01:48:42 UTC
From: Gmail - Kevin, Natalia, Stacey & Rochelle
Topic: 23698 Message: 23698

Hi Guys,

I was going through some gear of mine and came across; in excelent condition Pioneer DM-31 Dynamic mic.
I got this in my youth when I was doing a little DJing, with real records. That was a long time ago and then put away. I guess it has not been used for over 20 years.
Upon finding it I thought about using it with my TS-830S, the impedance are the same so this would make a nice shack boom mic.

So I am asking whether others have used a normal mic (not ham radio releated) mated to a ham radio?
Guessing I am asking about the quality of audio?
If overall acceptable, I will make a foot/hand PTT switch and an adaptor cable for the phono plug and the 4-pin socket on the radio.

Regards for any feedback.

Kevin, ZL1KFM.

I tried to do a search via Google with limited success unless I wanted to buy the manual, No.

Paul,

Congratulations on your choice of wife! I know of many hams whose wives (or husbands) are at best indeifferent to the hobby, & sometimes blatantly hostile. Mine, like yours, wouldn't let me sell a rig even when times were at their worst for us. She's never given me a bit of hassle over any piece of gear that I needed (or wanted) to buy. We just worked together to make adjustments to the budget.

She knits (& lurks) for a hobby. If she needs needles, yarn, a whatever--she gets it--no argument from me.

Do whatever you can to support her & let her know how much you appreciate her supporting you.

Also, kudos to you for placing your family ahead of yourself in the first place. In my book, that's one of the defining elements of a true man.

From: Chris and Alex
Topic: 23695 Message: 23700

Ask on here if someone local to you wants to schedule a QSO then you can
both swop reports and experiment with alc and processor without the
influence of propagation. It's something I'd like to do but I'm a bit far
away.

Chris

Hi TS-520s etc Gang,

I would like to obtain an original MC-10 Hand Microphone originally
available for the TS-520. It is unique in that it's output impedance is 50k
ohms.

Tnx es 72/73 de Howie K3HW

Pioneer DM-31 Dynamic mic.
I got this in my youth when I was doing a little DJing, with real records.
That was a long time ago and then put away. I guess it has not been used for
over 20 years.
Upon finding it I thought about using it with my TS-830S, the impedance are
the same so this would make a nice shack boom mic.

So I am asking whether others have used a normal mic (not ham radio
releated) mated to a ham radio?
Guessing I am asking about the quality of audio?
If overall acceptable, I will make a foot/hand PTT switch and an adaptor
cable for the phono plug and the 4-pin socket on the radio.

Regards for any feedback.

Kevin, ZL1KFM.

Dr OM Kevin: I use a Heil PR-20 studio mic. In my opinion not really a ham mic. for DXing but very nice for casual rag chewing. I get good reports. When DXing in rough conditions or during contests, I use a different mic.. a Shure 521 hand mic. that has hi tones VS low mellow ones. I did modify my D-104 by tring different resisters in line with the green wire (audio) and get good reports from it too. Variety is the spice of life, you can't hurt your rig so why not?

What ever floats your boat and after all, your the boss. Try it. 73 Rich K8UV

>
> One additional comment. The primary source of drift in the 820 is instability in the 9VDC supply which powers the VFO whether internal and/or external. Instability in the 9VDC AF AVR supply affects the stability of the VFOs which causes drift in the 820. Instability in

the 9VDC supply is typically caused by D5 (6 volt zener) and regulator Q7 (2SA496Y). Replacing both components will significantly reduce the drift in the 820.
>
> You can obtain both components, D5 and Q7, from the following website.
>
> http://www.electronicsurplus.com/ccp78762-to-220-pnp-transistor-2sa496-y-13844.htm
>
> Any 6.1 volt 1/2 watt zener will work fine as a replacement for D5. The above website sells a 6.1 volt 1 watt zener for 25 cents each, must purchase minimum of 4, which will also work fine.
>
> http://www.electronicsurplus.com/ccp77886-6-2v-1w-525-do-41-axial-zener-diodes-min-purchase--1n4735a-22930.htm
>
> I have an 820 that had a significant amount of drift after the 30 minute warm up period. I replaced both D5 and Q7 on the AF AVR board and the drift was significantly reduced to factory specifications. If you replace D5 and Q7, you will have to readjust the 9VDC then the 3.3VDC adjustments on the AF AVR board.
>
> I reused the heat sink on Q7. I simply applied some additional silicon grease between the transistor and the heat sink. The heat sink will feel warm to the touch, which is normal, during normal operation.

Dan,

You can download the operator and service manuals plus a high resolution schematic of the 820 at the following link:

www.n6wk.com/kenwood/

Scroll down the page and click on the appropriate link.

Hi Dan,

This is normal and I would expect it in any radio of this age.
Buy some De-Oxit if you don't have any. Thoroughly spray it into the function switch between any adjacent wafers. You probably won't be able to see whether its actually cleaning the contacts but it will. I use the plastic extender tool supplied with De-OXit to get the spray between the segments. I spray it thoroughly once, work the function switch thru all positions 14-20 times, then repeat the process one more time. Then I return the radio to its normal orientation on the bench and let it drip dry for at least 24 hrs before applying power.

FYI, I have now fixed dirty function switches in numerous Kenwoods (520/820/830) and several Yaesu FT-101's. 30+ years of use/storage almost certainly suggest on any of these old sets I expect to have function switch continuity issues in some positions. BTW, its not a bad idea to inspect the bandswitch segments for tarnish as well. If they have any I spray them, run the bandswitch 15-20 times thru each position, drain/dry as well.

De-Oxit is found at Antique Electronic Supply in Tempe Az, Fry's Electronics, and probably a whole host of suppliers. They have several strengths available, the DeOxit D5 (red/black label) is plenty good for this application.

FYI,

Greg

23732. [TS-520_820_530_830] DMP 31 Mic from Kiwi land

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-03 09:18:40 UTC
From: Walt Breining
Topic: 23709 Message: 23732

Usually I can find information on just about any pro mike but I can't find this one. I am guessing that it is high impedance, dynamic. Give it a try, it might sound good.

I enjoy using professional vocal and studio mikes on amateur radio, particularly antique ones.
I made a PTT switch out of a bottle that diabetic test strips come in. I placed a square PTT button on the bottom end and brought out a piece of flexible RG-58 to the mike plug.

Hiel Sound makes a very nice unit that does this.

Do not worry too much about impedance. If you use a low impedance mike on a high impedance rig, the level may be low. If you use a high impedance mike on a low impedance rig, the level may be low and the frequency response may be narrowed but probably not enough to notice with the narrow bandwidth of Amateur Radio.

If you don't like how it sounds, tell us what is happening and we will offer some tips.

Please note that we have a Yahoo group associated with this one called KenwoodMics.

Another cool Yahoo group that I have joined is micsANDaudio

Subject: [TS-520_820_530_830] DMP 31 Mic from Kiwi land

Kevin wrote:
I was going through some gear of mine and came across; in excellent condition
Pioneer DM-31 Dynamic mic.
I got this in my youth when I was doing a little DJing, with real records. That was a long time ago and then put away. I guess it has not been used for over 20 years.
Upon finding it I thought about using it with my TS-830S, the impedance are the same so this would make a nice shack boom mic.

So I am asking whether others have used a normal mic (not ham radio related) mated to a ham radio?
Guessing I am asking about the quality of audio?

If overall acceptable, I will make a foot/hand PTT switch and an adapter cable for the phono plug and the 4-pin socket on the radio.

Regards for any feedback.

Kevin, ZL1KFM.

Dr OM Kevin: I use a Heil PR-20 studio mic. In my opinion not really a ham mic. for DXing but very nice for casual rag chewing. I get good reports. When DXing in rough conditions or during contests, I use a different mic.. a Shure 521 hand mic. that has hi tones VS low mellow ones. I did modify my D-104 by tring different resisters in line with the green wire (audio) and get good reports from it too. Variety is the spice of life, you can't hurt your rig so why not?

What ever floats your boat and after all, your the boss. Try it. 73 Rich K8UV

A quick and easy way to interface is to use a transformer off an old pc
modem card. PC repair shops will give them away. If the level isn't right
just turn it around.

Here is a schematic for a nice simple interface much like what the old
Digipan interface was like. Very few parts needed.

http://www.qsl.net/wm2u/images/interface_kb8xi.jpg

I got my DIgipan interface from a ham that was downsizing and have
used it with my Icom IC-820 and a number of other HF and VHF+
radios with no problems for any of the digital modes from SSTV to WSJT.
I haven't used it with my FT-520s yet, so you'll have to figure out how to
interface it properly.

The SingalLink USB is the best and easiest way to go and you don't have to build it. Also, it will allow you to use almost other digital modes. Cost with cable is about $100.

Hi all,

I am planning to replace C-15 and C-16 (the caps on the 300V line I believe)in my TS520SE, which I see from one simple picture in the Service Manual sit in the metal box under two small PWB's in the left back corner of the radio. I have not removed the boards yet so I went to the service manual to see what I could find out about these two 22uf caps.

The drawing isn't clear what they are physically. So, if anyone has been into this before can anyone tell me if they are "clamp mount" electrolytics, twist mount "er-what"???

Thanks for your help,

Greg

Hi all,

I am planning to replace C-15 and C-16 (the caps on the 300V line I believe)in my TS520SE, which I see from one simple picture in the Service Manual sit in the metal box under two small PWB's in the left back corner of the radio. I have not removed the boards yet so I went to the service manual to see what I could find out about these two 22uf caps.

The drawing isn't clear what they are physically. So, if anyone has been into this before can anyone tell me if they are "clamp mount" electrolytics, twist mount "er-what"???

Thanks for your help,

Greg

Greg,

The capacitors you are talking about are actually 2 capacitors in each can. C15 is actually two 22ufd 450VDC capacitors in a can. The same goes for C16. Both C15A/B and C16A/B are located on the top left rear under the MARKER and VOX UNIT boards. Each can is mounted using a chassis mounted clamp.

You should inspect the bottom of each can by removing the top and bottom covers. Turn the 520 upside down with the front panel facing you. The bottom of each can can be inspected on the right rear. Each capacitor can has 3 leads, 2 positive terminals and 1 ground.

Look for bulges or a broken seal between the capacitor terminals. If a bulge or broken seal is found then the capacitors need replaced.

The 520, 520S, 520SE, 820, and 820S all have the same dual capacitor cans. Directly dual capacitor cans are no longer available. To replace the capacitors, individual radial lead capacitors are used. I replaced both cans, 4 capacitors, with 4 individual radial lead 22ufd 450VDC capacitors, new 470K 1/2 watt resistor, and a multi-tab terminal strip. It's a tight fit but it can be done if you take your time and think how you will mount the terminal strip and the caps.

Thanks Mike,

I was aware that they are dual section caps. There are some 30uf duals available @450V I plan to use. I also planned to replace the resistors. I would rather not have to "jury-rig" with separate radials or axials but in a pinch I guess it works.

Thanks for the answer on the clamp mount.

Greetings Group, I find I am in need of a replacement 'R' Tune variable capacitor to replace the damaged one in my tuner. I called Kenwood and 'Leo' advised there are none available in North America or Japan.

Any assistance locating a good replacement variable cap either new or reclaimed or any suggestions to effectively repair the broken shaft would be most welcome and greatly appreciated.

Hello All,

I'm getting ready to set up my station with the TS-830S. I'd like to add a remote VFO for split operation and a transverter for 6 meters. However, the Kenwood dedicated VFO's are expensive [~$275] and the dedicated 6m transverters are hard to find and don't get great reviews. Could I use a VFO-120 or VFO-820 on the TS-830S or could I use a
VFO from another manufacturer? Someone suggested just receiving on another receiver at the split frequency [always on?] is cheaper and easier. Could I use any 6m transverter that converted to 10 meters? Any
advice/recommendations greatly appreciated.

Topic: 23746 Message: 23746

.
.
.
Hello All,

As most know, I am just re-starting my Amateur Radio hobby after an absence of about 30 years. I am severely restricted by finances (I am a 74 year old State Pensioner!), but for the problems I have, even more restricted!

I now have a 'basic' rig set up, with the TS 520SE, AT230, SP23, HiMound HX 703, and MC50. I have been buying it in slowly over the last few weeks off Ebay.

Last item, I need now, is a half-decent Antenna.

I am in the middle of a large city, with absolutely no garden, just a small concrete slabbed, back yard about 15 feet long, with a 5ft high brick wall round it. I am in the middle of a row of 'town houses'.

I have been reading a lot on 'verticals' (my only option), but even second user 'Butternuts', or Diamonds, etc., are too expensive, also there is no room for ground plane radials. A real problem!

What I am looking at now, is to buy a new 6.6 metre CB 5/8 vertical antenna, and to feed it with an UNUN 9:1 Magnetic (Balun) Coupler. Total cost with all new, about 40 of your US Dollars!

I would mount this on a 9ft Steel pole (to get the RF away from Dogs and children!), with a copper earth rod driven into the ground immediately under it and earthing the outer of my coax there, (from the balun) at the farthest corner of the back yard wall.

I am then thinking of another copper Earth Rod driven into the ground under my living room window 15 ft away from the antenna to earth my rig from in the house, as well as another earth to a clamp on my water pipe, under the kitchen sink (where the Mains electricity is also earthed).

Sorry to 'ramble on' but I wanted to explain my plans in detail, to get evaluations of my thinking / ideas, for members to come up with better suggestions / ideas, to get me the most 'Bang per Buck!'

There is a 'commercial' vertical here on sale on Ebay, which I think is possibly exactly what I am thinking of doing. It is about 75 US Dollars.

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=300363951551&ssPage\
Name=STRK:MEWAX:IT

Another idea I had was to use a hollow fishing pole about 9 or 10 Metres long, standing in a glass or plastic jar on the ground, with the 9:1 balun inside it the jar (and sealed), and to use a length of co-ax inside the whole length of the pole, using just the outer (or short inner and outer at each end?). It could start at ground level, as the tube would insulate the radiator, and also the connection from the Balun and feed coax outer would only be a few inches to the Earth Rod.

Any comments or suggestions are very welcome, before I start on this project,. and make a mess of it!.

Kind thoughts and 73's de G3OBU

John

Hi Roy,

No you cannot use any of the VFO's you mention in your email. You are pretty much limited to the VFO-230 . Other transceivers have very different mixing schemes and their VFO's will not work.
Yes, you can use any transverter, you will just have to make up your own cables and make arrangements to power the transverter. You are not even limited to 10M IF for the transverter. You can choose to use 10M or even 20M, although most people use 10M because there is less chance of IF feed thru interference.

Roy: Low power (10-15) watt transverters are out there but it would be advantageous to have a bit more power when working on a band that can be subjected to weaker signals. You might look at the tube-type Heath SB-100 or -110A SSB/CW 6m transceiver or the Hallicrafters HA-6 transverter which uses 28 MHz as the RF input frequency. Both are in the 100W power range. The Drake TR-6 transceiver or their TC-6/SC-6 transverter are excellent 300W PEP rigs but can be a bit pricey due to scarcity.
Good luck - 6m is a great band. Your TN location should put you in good stead for E-skip contacts in the East and Mid-west US as well as the Caribbean, S. America and perhaps across the Atlantic during a good band opening.

Roy,

The VFO-120 works well with the TS-530 and 830. Been using one for years. It's smaller and cheaper than the VFO-230 or 240. Looks like a shrunken VFO-240.

Hi You might try a Tak-tenna. They are easy to construct and tune and cost less than $150 with shipping. They are on a 30 inch boom, kind of a spiral dipole. NO ground radials are needed if mounted in the vertical position. You can use it horizontal or vertical. In horizontal it has a certain amount of directional ability. The antenna tunes to better than 1.2:1 SWR on 40 meters. You will need a manual tuner to work other bands, but it is easily doable. After tuning mine up, I hit a station 2000 miles away on my first try with 100 watts. The antenna is mounted on 1 inch PVC pipe, 6 feet off of a CONCRETE pool deck using an umbrella stand! Check the reviews on eham.

Hi John. I would be very Leary of that commercial antenna. At 21, it will be resonant somewhere between 12M and 15M (as a half wave). And This is the first time that I have heard of a 9:1 balun being used on an Amateur Radio transmitting antenna. And while most vertical antennas will work (sort of) without radials, they work far far better with them! Even a single radial for each band (that would actually be a counterpoise) is going to help the performance of the antenna. I have doubts about the CB antenna also.

Something that you might consider is a Hustlet 5BTV. They are not nearly as expensive as the others that you mention. It is a 5 band trap vertical They are very well made, although you may want to replace the nuts. bolts and screws with stainless steel or brass ones. The 5BVT can be ground mounted or mounted on a mast. When mast mounted, elevated radials are recommended. The elevated radials do not have to be in a strait line, they could be bent however you need.

Just my thoughts...

Hi
Thanks for your response
I have built a 50 ohm dummy load and tuned
as per instructions.It tunes fine. I checked swr with meter
And it reads 1.1 with dummy load and antenna
hooked up. Power is 100 watts.
Astatic mic has amplifier at base.
I tried making a contact and they came back
saying it was distorted.So it appears I have a
Microphone problem
I wlll try to build an amplifier with hi output
impedance
Any suggestions?

I suspect the distortion problem is being caused by the amplified D-104 microphone level control on the bottom of the microphone stand is turned up too high. This can result in excessive audio levels being applied to the microphone speech amplifier inside the 520 which results in over driving the speech amplifier.

Turn all audio processing OFF.

If you have another non-amplified high impedance microphone then connect it to the 520. Set the 520's front panel MIC gain so the transmit audio produces an ALC meter indication that does not exceed the ALC meter scale and the transmit audio is clean and distortion free. Make a note of the ALC peak indication during sideband transmit.

Remove the non-amplified microphone and connect the amplifier D-104 to the 520.

Look on the bottom of the amplified D-104 and adjust the screw driver level control to minimum (counter clockwise). Set the 520's meter to ALC and while speaking normally into the microphone in sideband transmit, adjust the screw driver level control on the bottom of the amplified D-104 base to the point where the peak ALC meter indication is the same as the non-amplified ALC meter indication. Once you achieve that point stop adjusting the level control on the bottom of the D-104.

If you do not have another microphone, leave audio processing OFF and set the amplified D-104 level control at minimum and the front panel MIC gain control at 9 o'clock. Set the meter switch to ALC and while transmitting in sideband and speaking normally into the microphone, adjust the D-104 level control so the ALC meter indication on peaks does not exceed the ALC scale. Once you have achieved this setting, stop adjusting the D-104 level control.

I do not recommend using an amplified microphone on the 520 or any hybrid. The 520's speech amplifier is more than capable of producing excellent transmit audio without the use of external audio processing or amplification in the microphone.

23759. Re: Antenna Designs / Problems

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-04 13:01:42 UTC
From: Music Maker
Topic: 23746 Message: 23759

.
.
Hello, and thank you for the quick response to my antenna problem.

I had already looked at the TAK-tenna, and that would cost a lot less, but is still expensive in UK at about 150 US Dollars - I think I may get one of these at a later point, after I have paid for my Grandchildrens Christmas 'Prezzies' !! - I really need something quick and cheap for 'now'.

The suggested 'Hustler' antenna is sadly just as expensive as the Butternut or Diamond antennas here in UK at over 300 dollars. Far too expensive for my limited funds!

[url]http://www.hamradio.co.uk/acatalog/Ant_Amateur_BHF_Vert_Hustler.htm\
l[/url]

I have done a lot of reading on the internet and have come (rightly or wrongly! HI) to the following conclusions ....

All metal objects have a resonant frequency, from a cuff-link to a long length of wire (we all know the formula!). Ideally, for antenna construction, an antenna should be a multiple or divider of the resonant full wave length of the frequency we wish to use. Anything other than this has to be a compromise. This can be overcome by using coils in the antenna length, which will reduce the physical length required, and other capacative, inductive or resistive combinations to achieve this resonant length to 'appear' at the feed point.

OR !!!

You can use an UNUN (Unbalanced to Unbalanced transformer), which is NOT a Balun (Balanced to Unbalanced) to produce the required RF impedance (50 Ohms) required at the feedpoint.

A 9:1 UNUN Transformer, will provide an unbalanced 50 Ohm feed point, to almost any length of wire or metal. which may or may not be resonant at the frequencies required.

This does not say that the random size antenna will be as efficient as a properly tuned length, but it does ensure that the random length presents a proper match to the Rx / Tx of between 25 and 90 Ohms, which can be converted to the required 50 Ohms by the use of an Antenna Tuning Unit.

My current thinking is that a ready made (and very cheap!) CB vertical 5/8 wave (6.6 Metre length) antenna would make an ideal and tidy

solution to my problems, with a 9:1 UNUN at its base, or perhaps, better still, a longer 'Carbon Fibre Fishing rod', with wire for the antenna inside it, would give a longer than 18ft length of the CB Antenna, surely a longer antenna length would increase its efficiency, even if not resonant?

Please read the following on the 9:1 UnUn .....

Professional ...
[url]http://www.snowdonia-radio-company.co.uk/unun-transformers.html[/ur\
l]

Amateur ......
[url]http://www.hams4u.com/kc0pet/9_1%20unun.htm[/url]

[url]http://www.bobsamerica.com/9-1balun.html[/url]

From the 'old days' when I first came into Amateur Radio (I was licenced in 1956 - Geez, that was over 50 years ago!!), when we used to experiment with everything, building our own receivers and Transmitters, etc. Today, with the advances to solid state high efficiency Transceivers, which are almost untouchable - the Antenna system is about all that is left to experiment (or mess!) with, unless of course, a person is of a very high technical (or genius) standard.

In those 'old days' - the antenna was everything, and I worked well over 100 countries CW with my first Transmitter - a single valve (6v6) 'homebrew' with all of 2 watts !! Sadly, I now have no space for the Aerial Farm I had in those days, and the limited 15ft X 15ft space I have now, in the centre of a large city, needs some serious experimentation!

Further comments and discussion would be appreciated, by you much more 'savvy' guys in the Group than myself , and I am sure we can all learn something new!! (Thats Amateur Radio!).

Kind thoughts and regards,

John G3OBU

Hello

Mine AT 350 shows the caps is all in, when the knop says 0, and the caps is like a cirkle when the knop is pointing on 10... so you can adjust the knops by skrew it loose and fasten it again in the right possition.

I have a external homebrew SWR meter inline between the tx and the AT 350, and never used the built-in awr, so I know not the answer on your "translation" quwstion

Vy de OZ1HYI Willy.. Also 5P1W..

Hello John,

I have just opened up my AT 230 to look for you.

Fully Closed (Rotor Blades level with Stators) - are at '0' on both
Capacitors.

It is easy enough to change them to point wherever you want, just by
loosening the grub screw on the knob, and re-tighten on the place you
want it to point.

I too bought mine off Ebay (UK), for appx 170 US Dollars, and have
converted mine to have an internal dummy load inside, when you switch to
'Dummy Load' - the pictures and details are on my web site at
[url]http://www.john4music.tv/27.html[/url]

Kind regards,

John (another one !!) G3OBU

The Mystery Antenna you can build for less than the Grandkids presents cost nowadays. check it out here: http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=13121 even in a limited space you can get on the air.

Subject: [TS-520_820_530_830] Re: Antenna Designs / Problems

.
.
Hello, and thank you for the quick response to my antenna problem.

I had already looked at the TAK-tenna, and that would cost a lot less, but is still expensive in UK at about 150 US Dollars - I think I may get one of these at a later point, after I have paid for my Grandchildrens Christmas 'Prezzies' !! - I really need something quick and cheap for 'now'.

The suggested 'Hustler' antenna is sadly just as expensive as the Butternut or Diamond antennas here in UK at over 300 dollars. Far too expensive for my limited funds!

[url]http://www.hamradio.co.uk/acatalog/Ant_Amateur_BHF_Vert_Hustler.htm\
l[/url]

I have done a lot of reading on the internet and have come (rightly or wrongly! HI) to the following conclusions ....

All metal objects have a resonant frequency, from a cuff-link to a long length of wire (we all know the formula!). Ideally, for antenna construction, an antenna should be a multiple or divider of the resonant full wave length of the frequency we wish to use. Anything other than this has to be a compromise. This can be overcome by using coils in the antenna length, which will reduce the physical length required, and other capacative, inductive or resistive combinations to achieve this resonant length to 'appear' at the feed point.

OR !!!

You can use an UNUN (Unbalanced to Unbalanced transformer), which is NOT a Balun (Balanced to Unbalanced) to produce the required RF impedance

(50 Ohms) required at the feedpoint.

A 9:1 UNUN Transformer, will provide an unbalanced 50 Ohm feed point, to almost any length of wire or metal. which may or may not be resonant at the frequencies required.

This does not say that the random size antenna will be as efficient as a properly tuned length, but it does ensure that the random length presents a proper match to the Rx / Tx of between 25 and 90 Ohms, which can be converted to the required 50 Ohms by the use of an Antenna Tuning Unit.

My current thinking is that a ready made (and very cheap!) CB vertical 5/8 wave (6.6 Metre length) antenna would make an ideal and tidy solution to my problems, with a 9:1 UNUN at its base, or perhaps, better still, a longer 'Carbon Fibre Fishing rod', with wire for the antenna inside it, would give a longer than 18ft length of the CB Antenna, surely a longer antenna length would increase its efficiency, even if not resonant?

Please read the following on the 9:1 UnUn ....

Professional ...
[url]http://www.snowdonia-radio-company.co.uk/unun-transformers.html[/ur\
l]

Amateur ......
[url]http://www.hams4u.com/kc0pet/9_1%20unun.htm[/url]

[url]http://www.bobsamerica.com/9-1balun.html[/url]

From the 'old days' when I first came into Amateur Radio (I was licenced in 1956 - Geez, that was over 50 years ago!!), when we used to experiment with everything, building our own receivers and Transmitters, etc. Today, with the advances to solid state high efficiency Transceivers, which are almost untouchable - the Antenna system is about all that is left to experiment (or mess!) with, unless of course, a person is of a very high technical (or genius) standard.

In those 'old days' - the antenna was everything, and I worked well over 100 countries CW with my first Transmitter - a single valve (6v6) 'homebrew' with all of 2 watts !! Sadly, I now have no space for the Aerial Farm I had in those days, and the limited 15ft X 15ft space I have now, in the centre of a large city, needs some serious experimentation!

Further comments and discussion would be appreciated, by you much more 'savvy' guys in the Group than myself , and I am sure we can all learn something new!! (Thats Amateur Radio!).

Kind thoughts and regards,

John G3OBU

Wire is not too expensive, we should build our own antennas.
 I put up a 160M dipole for less than the shipping cost of most factory built antennas !!!

O< big snip>

As your in the UK, do you remember a company down on the south coast,
used to advertise in Practical wireless, G W Radio or something like
that.He at one time had a large stock of stainless steel guided missile
wire, thin and very strong.
How about that and a weather balloon, they appear on the surplus market
as well from time to time.
If your QTH is reasonably sheltered you could get a quarter wave
vertical up for most bands. Its not a permanent structure so no
planning problems either. and cheap as well.

--
Best wishes

Richard Bown

Hi John
Your mention of a 9m fishing pole reminded me of this. Sounds like what you're looking for.
http://www.perite.com/vk7jj/squidpoles.htm
(Don't miss page 2 of the site)
I have no personal experience of this design, but have heard generally good reports of it.
There are also other homebrew vertical designs on the web.
Good luck with it
Geoff VK2HQA

Hello All,

As most know, I am just re-starting my Amateur Radio hobby after an

absence of about 30 years. I am severely restricted by finances (I am

a 74 year old State Pensioner!), but for the problems I have, even more

restricted!

I now have a 'basic' rig set up, with the TS 520SE, AT230, SP23, HiMound

HX 703, and MC50. I have been buying it in slowly over the last few

weeks off Ebay.

Last item, I need now, is a half-decent Antenna.

it may just be " turn down the gain" on the mike. you might be overdriving
the audio

Pardon me for this post but I have been looking every where for the manual and any other papers that came with a Palomar FC-40 Freq. Counter when it was new manual instruction etc., will pay $20. dollars for copies or original. Just thought someone here might have filed away.

I believe there is some serious confusion afoot??? The following is the question I just posted......the other question regarding the position of the capacitor plates was posted in January 2008!!!

Greetings Group, I find I am in need of a replacement 'R' Tune variable capacitor to replace the damaged one in my tuner. I called Kenwood and 'Leo' advised there are none available in North America or Japan.

Any assistance locating a good replacement variable cap either new or reclaimed
or any suggestions to effectively repair the broken shaft would be most welcome
and greatly appreciated. Email direct to: jd.hetherington(@)hotmail.com

John,

I believe you mentioned in your original message that you had an antenna tuner. If so, a random end fed wire will get you out quite nicely. I worked much DX for a number of years with 100 W and an insulated #12 wire that exited my window, went up the side of my house, over the top of my roof and the end was tied off to my back fence. Total length about 80 feet.

Your first problem may be your neighbors,

a good bit of advice that I used is to erect your antenna(s) and NOT transmit for about one month - this will protect you from any awkward neighbors that will blame you for anything!

Since you are considering CW and your neighbors are in the near-field there is a high probability of interference with neighbors equipment so the end of the back garden - farthest from all neighbors - may be the best choice, and you can use the wall as a support.

If like me you are lucky and have nice neighbors you could consider a feeder to the rear wall and a dipole running left and right along the wall as far as neighbors permit. This would be a reasonably good NVIS antenna. It could also be used as radials for a vertical.

I have a 7m and a 9m fiberglass fishing pole in my back garden as supports for my 20m resonant dipole, they have been up for a few years now with no problems, so I can recommend fishing poles.

I am considering converting the 9m pole into a helical/squid/rubber-ducky vertical but haven't tried yet, I'll post here if/when I try.

You may have just enough space for a 10m resonant dipole sloping from the top of your building to the rear wall.

That's all that comes to mind for the moment ... good luck and 73's 2E0YAH

Subject: [TS-520_820_530_830] Antenna Designs / Problems

.

.

.

Hello All,

As most know, I am just re-starting my Amateur Radio hobby after an

absence of about 30 years. I am severely restricted by finances (I am

a 74 year old State Pensioner!), but for the problems I have, even more

restricted!

I now have a 'basic' rig set up, with the TS 520SE, AT230, SP23, HiMound HX 703, and MC50. I have been buying it in slowly over the last few weeks off Ebay.

Last item, I need now, is a half-decent Antenna.

I am in the middle of a large city, with absolutely no garden, just a small concrete slabbed, back yard about 15 feet long, with a 5ft high brick wall round it. I am in the middle of a row of 'town houses'.

I have been reading a lot on 'verticals' (my only option), but even second user 'Butternuts', or Diamonds, etc., are too expensive, also there is no room for ground plane radials. A real problem!

What I am looking at now, is to buy a new 6.6 metre CB 5/8 vertical antenna, and to feed it with an UNUN 9:1 Magnetic (Balun) Coupler.

Total cost with all new, about 40 of your US Dollars!

I would mount this on a 9ft Steel pole (to get the RF away from Dogs and children!), with a copper earth rod driven into the ground immediately under it and earthing the outer of my coax there, (from the balun) at the farthest corner of the back yard wall.

I am then thinking of another copper Earth Rod driven into the ground under my living room window 15 ft away from the antenna to earth my rig from in the house, as well as another earth to a clamp on my water pipe, under the kitchen sink (where the Mains electricity is also earthed).

Sorry to 'ramble on' but I wanted to explain my plans in detail, to get evaluations of my thinking / ideas, for members to come up with better suggestions / ideas, to get me the most 'Bang per Buck!'

There is a 'commercial' vertical here on sale on Ebay, which I think is possibly exactly what I am thinking of doing. It is about 75 US Dollars.

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=300363951551&ssPage\
Name=STRK:MEWAX:IT

Another idea I had was to use a hollow fishing pole about 9 or 10 Metres long, standing in a glass or plastic jar on the ground, with the 9:1 balun inside it the jar (and sealed), and to use a length of co-ax inside the whole length of the pole, using just the outer (or short inner and outer at each end?). It could start at ground level, as the tube would insulate the radiator, and also the connection from the Balun and feed coax outer would only be a few inches to the Earth Rod.

Any comments or suggestions are very welcome, before I start on this project,. and make a mess of it!.

Kind thoughts and 73's de G3OBU

John

If your budget will run to it, I've found that the best way to deal with neighbours in these situations is to say nothing about what you're planning to do, just buy them a nice holiday somewhere.

They might not like what they see when they get back, but they'll feel awkward about saying anything after such a nice treat :-)

Hi Guys. If john has to worry about his neighbors, a stealth antenna may be best. A vertical antenna could be placed inside some PVC and disguised as a flagpole or as a support for a bird feeder etc... Wire is also very stealthy. In my experience, most people seldom look upwards without a reason to do so. Also, small guage wire # 20 or #22) is small enough that it is hard to see more than a few feet away unless the light is just right. I am sure that anyone interested in stealth antennas can find plenty of ideas with a little searching on the net.

23778. G3OBU needs an antenna

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-05 21:29:21 UTC
From: Rich Jones
Topic: 23778 Message: 23778

Jonh: The ebay vertical looks pretty good for the price. I however doubt it will hear very well on the low bands compared to a some what resonant wire dipole. Again, you have a very small footprint for your back yard and it may be your only solution for now. I bought a TakTenna and sold it last summer to a ham for $30.00 US. I did not hear very well compared to wire and was an experiment that cost more than it was worth. Others may have good luck with it but compared it to others and it was a big looser. Save your money. I wonder if you have looked into a 4 square wire antenna? Four poles and wire 15 foot on each side of the four square. Kinda like a vertical single element quad antenna. You will have to load it with your antenna tuner but it might be a good simple low coast antenna to start with. I am sure it will hear better at the low freq's than the vertical. Just my 2 cents worth. Good luck Rich K8UV

Hello Stephen,

I have just checked US Ebay & UK Ebay, and the same 3 TS520 Fans are advertised both in the US and UK.

The cheapest one is 25 US Dollars, and from the text, it would appear they are new. Postage UK to US Airmail takes about 3 days, and I guess it would be about 15 dollars.

Have a look here - I know the seller, or at least I have bought gear off him and he is A1

.
.
.
Hi Everyone,

May I thank the many who responded to my distress call. I have taken much of the info on board, but in the end have decided to go my own 'experimental' way.

I have ordered from Ebay, a new 7 Metre Fibreglass pole. This will be strapped to my clothes-line post in the back yard. I am going to drill a hole in it about 12" from the ground, and will have a 7 metre length of #16 Earth wire inserted through this hole, to the tip of the pole. This will be the antenna. The bottom end I will be attaching to a 9:1 UnUn (it comes sealed in a box). The inner of the coax feed line will be attached to the antenna wire, and the outer to a copper earth spike at the base. I am then making an RF Choke (10 ft of the coax coiled 7 times round), and into the house a run of about 20 feet, to connect to my Unbalanced 50 Ohm connection socket on the Kenwood AT 230 Tuner.

I will let you all know the results, and pics when it is finished (about a week, as have only just ordered all the bits on Ebay). Total Cost 38 Pounds (Appx 50 dollars).

Thanks everyone for your advice and opinions. I will not be using 160 or 80 Metre bands other than listen, BTW. I usually do Dits and Dahs on 40, and SSB on 20.

23783. TS 820 TUN and CW not working

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-06 15:09:13 UTC
From: k4mau
Topic: 23783 Message: 23783

Hello to the group
I'm new hear and am looking forward to learning about these wonderful radios. My current station is a FT-1000MP MK V Field, and AL80B. Just some back ground on me. I've had this station set up for 7 years or so.
I just got a TS-820S a few days ago. I was aware of the problems from the start so it's a project rig.
Here are the prblems. In TUN, CW and FSK mode switched to send it shows 60 ma but no carrier output, and the display on the lower bands reads 9.000. On the higher bands in TUN, CW or FSK , and switched to send the display goes to 19.000 with 60ma and no output. I can tune up the final in USB and LSB by transmitting a modulated to into the mic. I get 100+ watts out, and have had it on hte air in SSB no problems. I just don't like tuning it up like this.
Also on 80 meters it will only go up to 3.953. The VFO can still be turned on higher, but it not changing frequency. I works fine on all other bands.
Any suggestions and help is appreciated.
Thanks to all.
Rob K4MAU

23784. 830S

Yahoo group: TS-520_820_530_830 (2009)

Topic: 23784 Message: 23784

Hi all
I'm new to group and immediately have a problem.
Recently acquired a TS830S and through my stupidity immediately manufactured a fault.
End result is this:-
The digital readout doesn't work.
If I am on 20m the digital readout shows 13.500.0 and stays there even though the Rx still tunes across the band. Not only that but if I change bands to 40m the readout still shows 13.500.0. But if I switch off and then back on the readout now shows 6.500.0 but again doesn't move and so on and so on.
Also the top relay chatters when I switch from CW to SSb.
Now my stupidity. I had tuned the rig (at this point working OK) with the meter in IC position - tuned for dip. I then moved the meter to RF and was disturbed. Returning a short while later I forgot I had moved the meter to RF and spent quite a long while trying to dip it!! After that the display packed in functioning correctly.
It tunes OK using the analogue so I guess the VFO board is OK. I think that leaves me with the PLL and counter board.
I haven't a clue where to start so can anyone help, please.

Victor,

Try removing all of the plugs, one at a time, giving each plug a light shot of contact cleaner. Insert the plug a few times then use canned air to remove any excess contact cleaner. Do this to each plug on the COUNTER unit. Once completed, visually inspect each plug to ensure it is properly seated and, when necessary, use canned air to remove all remain evidence of contact cleaner. Wait 3 to 5 minutes then test for proper operation.

Hi Rob,
Forget the display problem for now. It doesn't control frequency. Use the dial to control freq.

After 'tuning', turn the CAR to max and report the IP in CW mode. (with no key plugged into back)

Rob,

Since you didn't say whether or not you have the 820's operator's manual, you can download it at the following website:

www.n6wk.com/kenwood/

Did you follow the tune up procedures outlined in the 820's operator's manual?

If so what indication do you get with the meter set to ALC, MODE switch set to TUNE, CAR control set to 9 or 10 o'clock, and you adjust the DRIVE control? Does the meter indicate a peak meter reading or does the meter sit at zero?

I am selling a Nice working VFO-230 with Original Cable.
I checked it out and it appears to function great. The only cosmetic thing I see is that there is a small area on the top of the front Bezel where some of the paint has rubbed off.
I can provide pictures if requested.
I am asking $200.00 plus shipping.
If interested, please contact me OFF the list
n6wk at n6wk.com

Thanks,
Gordon

Hi
Boy you guys reply fast. Thanks! I hope I'm replying correctly.

Yes, I have down loaded the operators manual. Attempting to tune by the manual in TUN mode it will only show 60 ma idle current. It will not do anything else at all. No ALC, RF or give anything out to an external watt meter. CW AND FSK is the same way. It seems there is no carrier to the final to modulate it to tune up on. Also, when I switch to send in these modes the display will change to 9.000, or 19.000, or 29.000 band relavent. I am suspect of CAR 2 looking at the service manual.
In USB and LSB I can get out put, including readings on ALC, IP, and RF. HV reads 800 to 850. And the display will stay on the frequency it's tune to. I set the drive by peaking on the CAL signal. Then preset the Plate to the indicated band range, and set the Load about 12 oclock. I set the mic gain at 5, drive 12 oclock, key the transmitter and modulate with aaaaaaaahhhhhh,(hi hi), or whistle (on a dummy load of coarse), and dip the plate current. Then switch the meter to RF, and peak the load, and redip etc. Then adjust the mic gain back to and occasional alc peak, and I can easily get 100+ wattas out. I get good on the air reports no problem. If I drive the audio real hard the ip will go to about 220 ma. Under normal talking the ip is around 100 ma.
I would rather tune up using the TUN and CW, but ??? As to the problem on 80 meters,it stops at exactly 3.957. It's on frequency there, but it will not tune any higher. The VFO will continue to be turned but the reciever and transmitter will still be actualy on 3.957. It will tune all other bands up to the high end or the vfo fine. This problem is only related to 75 meters.
Sorry this was so long. There are other bugs that are minor. These , especially the TUN, CW, FSK problems ar what I would like to solve the most. My test equipment is limited, however I would still like to address this at home. With you alls help I feel I can. Thanks very much.
73 Rob

Go to the NTE website and look for the current replacement. Its probably an NTE 454 or an NTE 222. That 3sk41 is thirty year old silicon. There are replacements that are much better. Turst me, I replaced the old mosfets in my 520SE recently with new NTE parts.

Hi Jerry,

Use the NTE-222. I use them all the time and they work
perfectly.
I even keep a few in the drawer since they are used so commonly in these
old hybrids.
They are pretty inexpensive too. If you have problem locating some, let
me know and I can mail whatever you need to you.

23797. Re: [TS-520_820_530_830] VFO-230 For Sale

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-07 03:14:19 UTC
From: Jerry Keller
Topic: 11863 Message: 23797

That's an interesting offer, Gordon, I only need the one at the moment. It's Q3 in my TS-520 RF board, and I think it might be the key to getting adequate drive on 15M and 10M. I've changed the 12BY7 for a new one and have good drive on all bands 20M and below. Checking out the circuits has not been easy for me as all I have is a sig gen, a scope, and a VOM.... and I'm a novice with the scope. In fact, I'm trying to learn how to use it, and this TS-520 is my first attempt at troubleshooting an older rig. I'm thinking that I should rule out Q3 before proceeding. What would the cost be to mail the NTE222 to me? Also, any suggestions you might have would be very welcome.

Many thanks and 73, Jerry K3BZ

The "DH" button isn't "pressed in"/on is it? If it is in, the digital display will drop the MHz number, and show 027.6, instead of 14.027.6. The radio will still tune to other frequencies, but the digital reading will stay the same.

Subject: [TS-520_820_530_830] 830S

Hi all
I'm new to group and immediately have a problem.
Recently acquired a TS830S and through my stupidity immediately manufactured a fault.
End result is this:-
The digital readout doesn't work.
If I am on 20m the digital readout shows 13.500.0 and stays there even though the Rx still tunes across the band. Not only that but if I change bands to 40m the readout still shows 13.500.0. But if I switch off and then back on the readout now shows 6.500.0 but again doesn't move and so on and so on.
Also the top relay chatters when I switch from CW to SSb.
Now my stupidity. I had tuned the rig (at this point working OK) with the meter in IC position - tuned for dip. I then moved the meter to RF and was disturbed. Returning a short while later I forgot I had moved the meter to RF and spent quite a long while trying to dip it!! After that the display packed in functioning correctly.
It tunes OK using the analogue so I guess the VFO board is OK. I think that leaves me with the PLL and counter board.
I haven't a clue where to start so can anyone help, please.

I see it was mentioned briefly already, but the VFO-240 works great with the TS-830S, and you can get them for a lot less than a VFO-230. They show up from time to time on eBay, QTH.com, and eham.net. I bought one around a year ago for around $140 or so. They are a perfect match for the TS-530S, but they look good (and work good) with the TS-830S (just a different dial scale).

Hi,
As far as the VFO-240 versus the VFO-230. I believe the VFO-240 has the same vfo assembly in it that the TS-830 has in it which does have a little drift associated with it. The VFO-230 comes as a digital VFO and has no drift associated with it , rock solid. If you just plan on using CW or SSB the 240 is tolerable but if you plan on using any of the digital modes such as RTTY or Packet the 230 is the way to go.

Would you be open to a homebrew project? If so, I suggest that you consider building a magnetic loop. There are many designs for them on the web. In fact, here are a couple of useful sites:

http://www.magneticloopantenna.com/

http://www.standpipe.com/w2bri/

Properly constructed and tuned, a magnetic loop will outperform any other limited space antenna in my opinion. They do not require a lot of height in order to work well. They don't take up a lot of space. It won't cost too much to build one (if you use copper tubing that will cost some money as will the capacitor. Still, I suspect it would be manageable).

The downside to this antenna is that it has to be retuned every time you change frequency. This is a pain in the behind, but many think the solid performance is worth the aggravation. If you want to get fancy you can build one that is tuned remotely.

You also don't want to be too close to this antenna when you're transmitting. It will radiate like gangbusters and you want to be careful to observe the MPE limits. And you definitely want to put it where no person or pet is going to come into direct contact with it while you're transmitting. Put 100 watts into one of these things and it will generate extremely high voltages and lots of current (on the order of 15 amps). It can kill!

That said, if you're careful with it and have a decent spot for it, it will perform remarkably well.

Steve

Hi Everyone,
You were doing OK until
I have ordered from Ebay, a new 7 Metre Fibreglass pole. This will be
strapped to my clothes-line post in the back yard. I am going to
drill a hole in it about 12" from the ground, and will have a 7 metre
length of #16 Earth wire inserted through this hole, to the tip of the
pole. This will be the antenna. The bottom end I will be
attaching to a 9:1 UnUn (it comes sealed in a box). The inner of the
coax feed line will be attached to the antenna wire, and the outer to a
copper earth spike at the base.I read abiut the 9:1 UnUn ....
The 16 ft wire (if my M fo Ft conversion was correct) vertical will show you a fair match to the 50 ohm line, on 20M, without any tuner at all. Inserting a 9:1 xfmr will totally botch up the match on 20 and probably not help on 40 Meters.,...You will have either 5.5 ohms Z or 450 depending what way you install the UnUN, and thats only on 20M.
To get a good match to the 50 ohm coax on 20 and 40M, you need a trap on the base of the vertical that is transparent on 20 and will have some inductance on 40 to load the antenna enough to get 50 ohms Z.
If you can tune the trap correctly you will need no tuner at the radio end.
good luck

Question,

My TS-830S with the DH button in locks the frequency, Turning the dial stops the display, but the frequency changes as I can hear it sweep.
I still have, in the case of the suggestion below, 14.027.6, does not drop the 14. Is there something else that I am doing wrong?

Kevin,
The TS-830S I have here of my own Locks the display when I push in the DH switch, but it does NOT drop the 14 when on 14.027 for example.
I have seen other ones that do drop the mhz part off though. I prefer it to keep the complete digital read when I push the DH button in.
I am wondering if this is something that Kenwood changed from early to late units.
The one I have here is a Gold Edition serial number in the 3 million (by the way, Cleanest/Nicest TS-830S I have every seen and has all the filters)

Aloha All,
Heres a issue I am having with a TS-520S it has low RX audio and very low transmit power on LSB. USB and CW are fine 110W out and good RX audio. The RX level on LSB is the same as USB/CW but the audio level drops by at least 1/3-1/2 the level of the other modes. I am trying to get this going for a new ham. Any help will be greatly accepted.

73 and Merry Christmas.

Date: 2009-12-07 23:05:07 UTC
From: Bob
Topic: 23807 Message: 23807

The following is from the manual for the DH switch.

DH (DISPLAY HOLD) SWITCH
(WHEN THE DISPLAY DG-l IS USED.)
With this switch set to ON. the frequency below 100 kHz on
the display dial remains on even when the main dial knob is
rotated. This feature is useful to memorize the original fre~
quency when checking other frequencies. The DH switch
being ON turns off the liglits for "MHz" frequencies, elimina~
ting a worry about mis-reading frequencies.

I find it handy now that I am getting older. I can remember where I am most of the time.

Make sure you use at least 4 radials per band more of them would be better.

Date: 2009-12-07 23:38:24 UTC
From: Greg Anders
Topic: 23806 Message: 23809

Hi Roland,

It is possible that the carrier freq. on LSB is out of spec. One way to tell is to listen to band noise and switch between LSB and USB. Listen for the "pitch" of the background noise. If it is different pitch between the two the LSB carrier may be off frequency resulting in LSB not being centered properly in the pass band of the crystal filter. It is also possible (though not as likely) that if someone has been inside the unit and tweaked any of the IF's you could have the same scenario. However, the band noise-pitch test is easy and the cure is simple.

I hope this helps, let us know what you find/hear,

Greg

Date: 2009-12-08 00:28:50 UTC
From: Andrea
Topic: 23810 Message: 23810

Hello i Am Andrea from Florence IT.
My callsign is iw5ci and i like to collect Hybrid radios expecially Kenwood. Actually i own:
TS-520S line composed of TS-520S + vfo-520 + Sp-520 and DG-5
TS-830M line composed of TS-830M + Vfo-230 + SP-230
TS-820S line composed of TS-820S + VFO-820 SP-820 +SM-220 station monitor.
I have also a MC-50 mike and another TS-520SE.

Now all my radios are in perfect conditions except for the TS-820S
that i recently bought on ebay in non working conditions. I am restoring it , so i will post for help next days.

The previous ownet had caused a short circuit between ext vfo and radio so it was sold as junk also because before the accident with vfo, the digital display was broken, there was no power in tune, and the 160 meters band was not working.

At the moment i have fixed the tune mode replacing a resistor that was open (R6 in X43-1110-00 board), I have replaced Q9 in fix-vox board and a diode in the external VFO (now both internal and external vfo are working fine), then i cleaned all the contacts inside DG1 and the PLL unit and now i have again a working 160 meters band and the digital display (except for the 100HZ number that is still not operative.

So at the moment i have 2 problems with this wonderful radio:

LOW power in 20 meters: just 70W instead of 90-100W i have in other bands, the last digit of the frequency counter that is still inoperative. So if someone can give me an hand....

73!

Topic: 23783 Message: 23812

Rob,

Ok, based on your response, it appears one or both resistors, R5 and R6, on the HV unit have increased significantly in resistance. When this happens which is typically due to age, TUNE mode will not display any ALC indication during tune up.

Check R5 and R6, both 56K 1/2 watt resistors, on the HV UNIT. If one is bad, replace both, not just the bad one. The two 56K resistors form a voltage divider that controls the screen voltage applied to the final tubes in TUNE mode. It's better to replace both resistors if only one is found to be bad.

The HV UNIT PC board is located on the bottom of the 820 just forward of the power transformer. It's a small PC board with 7 resistors and a capacitor mounted on it. There should be 5 wires connected to it, one each at the following labels:

800, 210, FSB, TUNE, and HV.

If you do not have the 820 service manual you can download it from the same link I provided in my last response:

www.n6wk.com/kenwood/

Turn to page 17 and you will see where the HV UNIT board is located.

The resistors you are looking for have colored bands around the body of "GREEN BLUE ORANGE SILVER". There are only 2 of these 56K resistors on the HV UNIT. Check them with an OHM meter. You will have to remove them to verify their actual resistance.

>
> Yes, I have down loaded the operators manual. Attempting to tune by the manual in TUN mode it will only show 60 ma idle current. It will not do anything else at all. No ALC, RF or give anything out to an external watt meter. CW AND FSK is the same way. It seems there is no carrier to the final to modulate it to tune up on. Also, when I switch to send in these modes the display will change to 9.000, or 19.000, or 29.000 band relavent. I am suspect of CAR 2 looking at the service manual.
> In USB and LSB I can get out put, including readings on ALC, IP, and RF. HV reads 800 to 850. And the display will stay on the frequency it's tune to. I set the drive by peaking on the CAL signal. Then preset the Plate to the indicated band range, and set the Load about 12 oclock. I set the mic gain at 5, drive 12 oclock, key the transmitter and modulate with aaaaaaaahhhhhh,(hi hi), or whistle (on a dummy load of coarse), and dip the plate current. Then switch the meter to RF, and peak the load, and redip etc. Then adjust the mic gain back to and occasional alc peak, and I can easily get 100+ wattas out. I get good on the air reports no problem. If I drive the audio real hard the ip will go to about 220 ma. Under normal talking the ip is around 100 ma.

> I would rather tune up using the TUN and CW, but ??? As to the problem on 80 meters,it stops at exactly 3.957. It's on frequency there, but it will not tune any higher. The VFO will continue to be turned but the reciever and transmitter will still be actualy on 3.957. It will tune all other bands up to the high end or the vfo fine. This problem is only related to 75 meters.
> Sorry this was so long. There are other bugs that are minor. These , especially the TUN, CW, FSK problems ar what I would like to solve the most. My test equipment is limited, however I would still like to address this at home. With you alls help I feel I can.

Topic: 23783 Message: 23813

I suspect the problem with the digital display is the COUNTER UNIT need cleaning.

To do this you will have to remove the COUNTER UNIT from the 820. This is easily done.

1. Remove the power cable from the rear of the 820

2. Remove the top and bottom covers

3. Turn the 820 up on its right side (final cage against the table)

4. Locate the COUNTER UNIT and on the bottom of the COUNTER UNIT, remove the edge connector. Remove the multi wire plug on the top of the COUNTER UNIT.

5. Loosen the COUNTER UNIT mounting screw and gently lift the COUNTER UNIT from the 820.

6. Remove the outer cover from the COUNTER UNIT and note there are 2 PC boards inside the metal enclosure.

7. Loosen the mounting screws to one PC board and remove it from the metal enclosure. You will notice a set of fixed pins mounted to the metal enclosure. Give each pin socket on the PC board a shot of contact cleaner. Insert the board onto the fixed pins a number of times then secure the PC board onto the metal enclosure and tighten the mounting screws.

8. Do the same thing to the other PC board as stated in step 7.

9. When completed, use canned air to remove any excess contact cleaner and let the PC board sit for 3 to 5 minutes.

10. Install the COUNTER UNIT back into the 820 in the "reverse" order you removed it.

11. Give the bottom edge connector a short of contact cleaner and connect the plug to the bottom edge a number of times then full seat the connector onto the counter edge, ensuring it seats flat and not at an angle. Use canned air to remove any excess contact cleaner.

12. Give the multi wire plug a shot of contact cleaner and insert then remove the plug a number of time to the top pins on the COUNTER UNIT then seat the plug firmly onto the pins. Use canned air to remove any excess contact cleaner.

Let the 820 sit for a few minutes then reconnect the power cable, speaker, and power up the 820. Check the display, it should, providing nothing else is wrong, display the correct frequency and it should change according to the VFO setting.

Mike gave you the right Tip also my ts-820 had no power in tune. It Was R6 that was perfect from outside but opened at the ohmeter... Replacing both resistors solved all the problems.

To: TS-520_820_530_830@yahoogroups.com
From: w5rkl@...
Date: Tue, 8 Dec 2009 01:36:36 +0000
Subject: [TS-520_820_530_830] Re: TS 820 TUN and CW not working

Rob,

Ok, based on your response, it appears one or both resistors, R5 and R6, on the HV unit have increased significantly in resistance. When this happens which is typically due to age, TUNE mode will not display any ALC indication during tune up.

Check R5 and R6, both 56K 1/2 watt resistors, on the HV UNIT. If one is bad, replace both, not just the bad one. The two 56K resistors form a voltage divider that controls the screen voltage applied to the final tubes in TUNE mode. It's better to replace both resistors if only one is found to be bad.

The HV UNIT PC board is located on the bottom of the 820 just forward of the power transformer. It's a small PC board with 7 resistors and a capacitor mounted on it. There should be 5 wires connected to it, one each at the following labels:

800, 210, FSB, TUNE, and HV.

If you do not have the 820 service manual you can download it from the same link I provided in my last response:

www.n6wk.com/kenwood/

Turn to page 17 and you will see where the HV UNIT board is located.

The resistors you are looking for have colored bands around the body of "GREEN BLUE ORANGE SILVER". There are only 2 of these 56K resistors on the HV UNIT. Check them with an OHM meter. You will have to remove them to verify their actual resistance.

Hi
Thanks very much for the reply.
Yes the VFO light stays on when switched into the send position, and the display will change from the tuned freq to 9.0000,19.000 or 29.000 depending on the band selection. Again , this only happens in TUN, CW, and FSK modes. In LSB or USB the display and trans work normal (stays on the tuned freq, and has normal out put).
I understand about the R5 and R6. I will likley go ahead and change those resistor. But will they cause it to not transmit in CW? In CW switched to send or keyed with a key I get 60ma idle IP, but thats it. I cannot get it to trasmit at all in any of those modes (TUN,CW,FSK). Only get idle IP.
I will remove and clean the boards in the display unit. However the display stopping at 3.950 condition only happens on that band. Works normal on all other bands. As well it does not recieve any higher than the display reads. The reciever stops as well as the display. Again this only happens on this one band.
Thanks for the help. I am looking forward to more info and getting this old girl figured out. Using it on SSB has been a real treat.
Thanks again!

When you say there is no RF output in CW and FSK, what setting is the CAR control set at? RF output in both CW and FSK mode is controlled by the "CAR" control, not the MIC gain control.

23818. Looking for hand mic for Kenwood TS-820S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-08 18:16:00 UTC
From: renopithicus
Topic: 23818 Message: 23818

I just picked up a TS-820S on ebay. I'm really looking forward to it, as it will be my first trip into the world of hybrid rigs. Unfortunately, though, it is not coming with a mic. If anyone has (and would like to sell) one of the MC-35 hand mics, please let me know. You can email me at KC2SIZ (at) arrl.net.

Thanks!

23819. 6146A

From: Dick Merryman
Topic: 23819 Message: 23819

I have a NOS 6146A that was sent to me by mistake in a 6146B box. Anybody need it? The price is right - free. A couple of bucks to cover shipping appreciated but not required. Note that this tube will not work in a Kenwood hybrid.

23820. Finally get the radio to transmit

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-08 19:56:15 UTC
From: Ron Le Vine
Topic: 23783 Message: 23820

Greetings all,

I have the Kenwood ts-830s radio. After about 6 months of working on it, it finally transmits. The thing is though, it is only putting out about one watt and that falls off to zip in pretty short order.

Has anyone seen this before? All the tubes check out within spec. The tech I am working with thinks it may be a capacitor or two that have gone soft.

Any thoughts would be greatly appreciated.

With regards and 73,
Ron - KF7AYS

23821. RE: [TS-520_820_530_830] Re: TS 820 TUN and CW not working

Hi i know ... my 820 was really worse than yours but a step to another is returning in life.
The resistors cure only the tune problem but it's necessary you measure the resistor near r5 and r6 to see if you find an open resistor.
for the frequency counter i had the "9000" issue before cleaning it. The 3950 issue is not a really problem as the 80 meters band stops before...

Subject: [TS-520_820_530_830] Re: TS 820 TUN and CW not working

Hi

Thanks very much for the reply.

Yes the VFO light stays on when switched into the send position, and the display will change from the tuned freq to 9.0000,19.000 or 29.000 depending on the band selection. Again , this only happens in TUN, CW, and FSK modes. In LSB or USB the display and trans work normal (stays on the tuned freq, and has normal out put).

I understand about the R5 and R6. I will likley go ahead and change those resistor. But will they cause it to not transmit in CW? In CW switched to send or keyed with a key I get 60ma idle IP, but thats it. I cannot get it to trasmit at all in any of those modes (TUN,CW,FSK). Only get idle IP.

I will remove and clean the boards in the display unit. However the display stopping at 3.950 condition only happens on that band. Works normal on all other bands. As well it does not recieve any higher than the display reads. The reciever stops as well as the display. Again this only happens on this one band.

Thanks for the help. I am looking forward to more info and getting this old girl figured out. Using it on SSB has been a real treat.

Thanks again!

73 Rob

Hi, if i can suggest you the perfect mike for your hybrid beauty i would choose an MC-50 or an Astatic D-104 (preamplified) or a Turner +2

Hi. I see the MC-35 mics on eBAy once in a while, but they are pretty
pricy. I see on now but its in the UK. Pretty much any high
impedance mic should work though they may not sound as good as the
Kenwood mics. An MC-50 would work well with you TS-820.

From: Andrea Liverani
Topic: 23824 Message: 23824

I am still trying to fix my 820S i have restored cosmetically and now i must fix the remaining problems.

1) i have low power only in 20 meters 65W instead of 100-110 i have elsewhere. The strange thing is
that i obtain this power with load very advanced and plate on the 28 mhz position... and 14 mhz is just
28/2 .... strange isn't' it?
I have realigned the tx to peak alc at 14.175 as reported in the manual i have changed final tubes
the 12by7a and cleaned the band switch but i have still the problem.

2) i have no 100hz reading on the frequency counter at all the last digid is off all the time , all the other segments works fine.

Some advice?

HI Mike
Thanks for all your help. Changing the carrier setting doesn't make any change. And yes I realize the carrier setting controls CW out put. When I key with a key in CW I get the side tone and 60 ma idle IP but nothing else , and carrier doesn't have an effect. I did read about D5 and D6 before I purchased the radio. I was thrown off from them by no CW carrier. However I intend to replace those resistors .
Thanks again!
Rob

Hi Andrea
Thanks much for your help also. I do plan to remove and clean the VFO. However it does tune thru all other bands fine. I guess the last 50 kc of 75 meters isn't a big deal, but it does indicate a problem with that band. I have compared it with my other radios both TX and RX, and do know the 820 does indeed stop at 3.955 It's not just the display. My thought is if the VFO tunes all the other bands completely to the top end the VFO is working correctly. That leads me to think the problem is somewhere else with the 3.5 MHZ band. Any thought ae greatly appreciated.
Thanks
Rob

> HI Mike
> Thanks for all your help. Changing the carrier setting doesn't make any change. And yes I realize the carrier setting controls CW out put. When I key with a key in CW I get the side tone and 60 ma idle IP but nothing else , and carrier doesn't have an effect. I did read about D5 and D6 before I purchased the radio. I was thrown off from them by no CW carrier. However I intend to replace those resistors .

Rob, Andrea,

Stopping working on the top if the band is almost always a problem in the PLL unit. The tuning voltage to the VCO is then too high.
Usually it is just a re-alignment of the tuning voltage.
Download the service manual and study that part.
I do not have a TS520/820 myself, but this is a common fault in all PLL's of transceivers of that age.

My 2 cents,
73, Wim PA0PGA

> Thanks much for your help also. I do plan to remove and clean the VFO. However it does tune thru all other bands fine. I guess the last 50 kc of 75 meters isn't a big deal, but it does indicate a problem with that band. I have compared it with my other radios both TX and RX, and do know the 820 does indeed stop at 3.955 It's not just the display. My thought is if the VFO tunes all the other bands completely to the top end the VFO is working correctly. That leads me to think the problem is somewhere else with the 3.5 MHZ band. Any thought ae greatly appreciated.

for problem number 2.... dont look for voltage on each segment, look for common ground problem

I suspect your ground to the digit may possibly be lost..

23831. Re: TS 820 TUN and CW not working

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-08 22:51:17 UTC
From: w5rkl
Topic: 23783 Message: 23831

Rob,

All of the Kenwood hybrid VFOs operate on a specific range of frequencies. The 520 and 820 VFOs operate between 4.999Mhz and 5.500Mhz on ALL band. The 530 and 830, however, operate between 5.400Mhz and 6.100Mhz.

I assume the VFO tunes smoothly, no jumpy or erratic behavior occurs when tuning the VFO. If that's true then the VFOs working fine. If you have a frequency counter, pull the RCA plug cable from the rear of the VFO and connect the VFO output RCA socket to the frequency counter. Tune the VFO from the low end, 0.0 to the high end 500. The counter should display 5.500Mhz at the low end and 4.999Mhz or 5.000Mhz on the top end of the dial. If it does then, again, the VFO is fine.

Check the 9VDC supply on the AF AVR UNIT. Remove the top and bottom cover, turn the 820 upside down with the front panel facing you. The AF AVR UNIT is located directly below the VFO. The board 2 plugs along the front panel, AF1 and AF2. AF1 is on the left and AF2 on the right. Pins are numbered right to left, 1, 2, 3, 4, 5, and 6.

Connect you DC volt meter to AF1 pin 1 or 2. The voltage should be 9VDC If it is not then adjust VR4, in the middle of the board (not the large plastic pot, that's the RIT pot) so the volt meter reads 9VDC +/- .5VDC.

Next, move the DC probe to pin 6 on AF2. The voltage should be 3.3VDC. If it is not, adjust VR1, located between AF1 and AF2 plug, so the meter reads 3.3VDC +/- .5VDC.

The hybrids have a tendency to have dirty plugs on the PC boards. Also, the pins and plus do not always make good connections which leads to other problems. I had a problem where my 820 appeared, visually, to be working fine but, no receive and no transmit. The problem was one or more of the pins on a number of plugs that were simply not making good contact. I fed the 8Mhz IF signal to the IF board and I could hear it fine but nothing on transmit or receive. I remove all plugs, cleaned them, and put them all back onto their respective pins then ensured all board mounting screws were tight and it worked. I can't say for sure this will fix your problem, just a thought from my experience.

The VFO in ALL of the hybrids are powered from the 9VDC supply. Any instability in the 9VDC supply will affect the VFO's stability.

Drift in the 820 can be traced to the 9VDC supply and typically is caused by aging D5 (6 volt zener) and Q7 (2SA496Y) regulator, both on the AF AVR board. Replacing both D5 and Q7 will significantly improve the drift in the 820. You can find new Q7s at the following website.

http://www.electronicsurplus.com/ccp78762-to-220-pnp-transistor-2sa496-y-13844.htm

I bought 10 of them and replace Q7 and D5. The drift was significantly reduced to well within factory specs.

You can replace D5 with any 6.1 volt 1/2 watt zener. Mouser sells them cheap.

I would do voltage checks on the driver and final tubes.

There is a high resolution schematic with voltages you can read at n6wk's website.

www.n6wk.com/kenwood/

Scroll down and click on the 820 high resolution schematic. If you have already done this, disregard this recommendation.

73s
Mike W5RKL

Mike
I don't have a freq conuter. I do think the vfo is working ok as the freq stop problem is only on 75 meter. It tunes all other bands from one end to the other fine. 80/75 starts at 3.492 and stops at 3.953 at this moment. I will go up to 3.961 or so when first turned on and as it warms up it comes down to 3.953 or so. This is the actual freq of the radio as I described before. I'm thinking , as someone else suggested it may me in the PLL. It only does this on 75 meters, so I guess I can live with that for a while.
I'm running voltage checks at this time starting with the HV and Rectifier boards, and following through the shcematic that is in my service manual that came with the radio. I will check out the web site you suggested. A larger copy would be nice. As this is only a one page fold out and my eyes aren't near as good as they were.
At this point I guess the major concern is no TUN and CW to use to tune the final. Tuning up with a whistle isn't any fun. I will have to get some 56K resistor for the HV board. If you or anyone has any more thoughts about the TUN/CW issue please let me know your thoughts.
Thank very much to all.
Rob

>
> I assume the VFO tunes smoothly, no jumpy or erratic behavior occurs when tuning the VFO. If that's true then the VFOs working fine. If you have a frequency counter, pull the RCA plug cable from the rear of the VFO and connect the VFO output RCA socket to the frequency counter. Tune the VFO from the low end, 0.0 to the high end 500. The counter should display 5.500Mhz at the low end and 4.999Mhz or 5.000Mhz on the top end of the dial. If it does then, again, the VFO is fine.

Ron,

A quickie that's worth looking at is the soldered connections at the top of L2, the plate choke. If the tubes have been in and out a few times this joint gets dry and it's worth wetting it with a hot iron.

Chris

I had this problem as well. It would start at 100W and then after a few minutes nothing...the radio was in storage for nearly 20 years when I bought it and that solder connection was not good at the top of the choke. But I also had temp sensitive resistors in the cathode circuit. These would be fine cold but as they heated up and were used their resistance began to climb and then the IP would fluctuate rapidly under load. Let them cool and the radio would be fine. Wound up getting the resistor/capacitor kit from k4eaa - solved the problem and the radio runs like a champ now.

23835. broke my TS-520S (with keyer maybe)

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-09 02:48:05 UTC
From: Trav
Topic: 23835 Message: 23835

I'm new to ham radio, just got my license in October 2009, and bought a used TS-520S at a ham swap meet the same day. It was working good on both receive and transmit and I had just recently learned how to tune it up according to the user manual and to use my external tuner to tune up my dipole outside. Everything was looking good and I even made a voice contact once on 80 meters.

I have a straight key and a no-name keyer and paddle unit (which I got from my brother - a lapsed ham). I plugged in the keyer and it seemed to work, I got a side tone and tuning proceeded normally. A few days later I decided to try it again and use the side tone to practice my morse code. I left the heater switch off, checked the plate idle current, changed the mode switch to TUN, checked ALC, changed mode switch to CW, flipped the "tune" toggle switch on the keyer to close the contacts, dipped the plate, all okay. Then I turned the "tune" toggle off and began practicing with the keyer.

About three minutes later the tones suddenly dropped down to silence and nothing further would work. After shutting off the rig I let it cool for awhile and then turned it back on. It won't transmit and it won't receive either. Using the tune-up instructions gets me through the "dip the plate" step okay, but after switching the meter to RF to peak the meter with the plate and load controls there is no response from the meter. Also, no sidetone with either keyer or straight key.

On receive I can hear a smooth background hiss, and if I twist the drive knob I can hear the sweet spot go by with the slight sound of motorboat noise (probably from my pellet stove which is in the same room). The calibrator signal works correctly and is easy to hear. But there is no reception. I've checked the antenna connections and antenna tuner and all are okay and set normally as I've done before.

No smoke or smell was noticed, but I think I broke something. given that my electronics skills are rudimentary is this something I can try fixing myself, or will it require a trip to the shop?

thanks for all your help.

Jerry

From: Chuck Goelz
Topic: 23783 Message: 23836

Rob,

I can't help but think that the TUNE (which is a CW mode) and CW mode problem is due to the carrier oscillator (bad crystal, misadjusted coil, etc). The resonant circuits for USB, LSB, and CW are independent, but the rest of the oscillator circuit is common to all three modes.

Just my thoughts... If Mike disagrees, listen to HIM!! I always DO!

Cheers and GL,
Chuck WA3CEJ

From: k5lcl@sbcglobal.net
Topic: 23784 Message: 23837

The DH button works as stated for the TS-820. It MAY not drop the first digit or two for the 830, I don't know. But if the button is out, the digital display SHOULD change. Pressed in, it locks the display, but not the tuning capability of the VFO. The DH button is just there to help you remember where you LEFT in case you want to go back there the next time. It's really not much use.

Subject: Re: [TS-520_820_530_830] 830S

Question,

My TS-830S with the DH button in locks the frequency, Turning the dial stops the display, but the frequency changes as I can hear it sweep.
I still have, in the case of the suggestion below, 14.027.6, does not drop the 14. Is there something else that I am doing wrong?

Kevin, ZL1KFM.

The "DH" button isn't "pressed in"/on is it? If it is in, the digital display will drop the MHz number, and show 027.6, instead of 14.027.6. The radio will still tune to other frequencies, but the digital reading will stay the same.

Subject: [TS-520_820_530_830] 830S

Hi all
I'm new to group and immediately have a problem.
Recently acquired a TS830S and through my stupidity immediately manufactured a fault.
End result is this:-
The digital readout doesn't work.
If I am on 20m the digital readout shows 13.500.0 and stays there even though the Rx still tunes across the band. Not only that but if I change bands to 40m the readout still shows 13.500.0. But if I switch off and then back on the readout now shows 6.500.0 but again doesn't move and so on and so on.
Also the top relay chatters when I switch from CW to SSb.
Now my stupidity. I had tuned the rig (at this point working OK) with the meter in IC

position - tuned for dip. I then moved the meter to RF and was disturbed. Returning a short while later I forgot I had moved the meter to RF and spent quite a long while trying to dip it!! After that the display packed in functioning correctly.
It tunes OK using the analogue so I guess the VFO board is OK. I think that leaves me with the PLL and counter board.
I haven't a clue where to start so can anyone help, please.

23840. Re: TS 820 TUN and CW not working

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-09 14:13:36 UTC
From: w5rkl
Topic: 23783 Message: 23840

Glad to see more information is surfacing which helps in suggestions.

Someone said it could be the CAR UNIT. That's a possibility that should not be over looked. In addition to the CAR UNIT, I also suggest the PLL UNIT.

I recommend removing both the PLL and the CAR UNIT enclosures, one at a time, and clean each one. This means not only to clean the pins on the outer edge but to remove the 2 PC boards inside the enclosures and clean the pins and sockets on each board.

Remove each enclosure, one at a time, then remove the cover. Remove each PC board, clean the sockets and pins, then put the board back into the enclosure, secured with the mounting hardware. Do the same to the other board. Once completed, reinstall the unit back into the 820. Clean each plug and pin on the edge of the unit then install the plugs back onto the unit.

Do the same thing with the unit.

Once this has been done, check for proper operation.

Yes, I think it's a problem in the 3.5 mhz vco and i think you can fix it just with a small realignment of the single band vco.

To: TS-520_820_530_830@yahoogroups.com
From: wpenders@...
Date: Tue, 8 Dec 2009 21:55:27 +0000
Subject: [TS-520_820_530_830] Re: TS 820 TUN and CW not working

Rob, Andrea,

Stopping working on the top if the band is almost always a problem in the PLL unit. The tuning voltage to the VCO is then too high.

Usually it is just a re-alignment of the tuning voltage.

Download the service manual and study that part.

I do not have a TS520/820 myself, but this is a common fault in all PLL's of transceivers of that age.

My 2 cents,

73, Wim PA0PGA

>

> Hi Andrea

> Thanks much for your help also. I do plan to remove and clean the VFO. However it does tune thru all other bands fine. I guess the last 50 kc of 75 meters isn't a big deal, but it does indicate a problem with that band. I have compared it with my other radios both TX and RX, and do know the 820 does indeed stop at 3.955 It's not just the display. My thought is if the VFO tunes all the other bands completely to the top end the VFO is working correctly. That leads me to think the problem is somewhere else with the 3.5 MHZ band. Any thought ae greatly appreciated.

Subject: Re: [TS-520_820_530_830] 830S

The DH button works as stated for the TS-820. It MAY not drop the first digit or two for the 830, I don't know. But if the button is out, the digital display SHOULD change. Pressed in, it locks the display, but not the tuning capability of the VFO. The DH button is just there to help you remember where you LEFT in case you want to go back there the next time. It's really not much use.

Subject: Re: [TS-520_820_530_830] 830S

Question,

My TS-830S with the DH button in locks the frequency, Turning the dial stops the display, but the frequency changes as I can hear it sweep.

I still have, in the case of the suggestion below, 14.027.6, does not drop the 14. Is there something else that I am doing wrong?

Kevin, ZL1KFM.

Subject: Re: [TS-520_820_530_830] 830S

The "DH" button isn't "pressed in"/on is it? If it is in, the digital display will drop the MHz number, and show 027.6, instead of 14.027.6. The radio will still tune to other frequencies, but the digital reading will stay the same.

Subject: [TS-520_820_530_830] 830S

Hi all

I'm new to group and immediately have a problem.

Recently acquired a TS830S and through my stupidity immediately manufactured a fault.

End result is this:-

The digital readout doesn't work.

If I am on 20m the digital readout shows 13.500.0 and stays there even though the Rx still tunes across the band. Not only that but if I change bands to 40m the readout still shows 13.500.0. But if I switch off and then back on the readout now shows 6.500.0 but again doesn't move and so on and so on.

Also the top relay chatters when I switch from CW to SSb.

Now my stupidity. I had tuned the rig (at this point working OK) with the meter in IC position - tuned for dip. I then moved the meter to RF and was disturbed. Returning a short while later I forgot I had moved the meter to RF and spent quite a long while trying to dip it!! After that the display packed in functioning correctly.

It tunes OK using the analogue so I guess the VFO board is OK. I think that leaves me with the PLL and counter board.

I haven't a clue where to start so can anyone help, please.

Vic Waddington

23844. RE: [TS-520_820_530_830] 1 radio 2 problems!

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-09 08:28:46 UTC
From: Andrea Liverani
Topic: 23824 Message: 23844

yesterday i spent the evening trying to troubleshoot problem number 1
low power in 20 meters band.
I havent' solved the problem but i had some indications....

First of all i noticed that if i move the band switch while i am trasmitting
i see fluctuations in power and sometimes the power rises to 80-90 watt
as it should be.
If i Switch the grids off and i measure the alc signal while i am moving
the band switch there are no fluctuations. So i suppose that the section
of the band switch involved is the section inside the pa compartment
also because when i mode the band switch while in trasmission i can
ear some eletric noise inside the PA compartment as something is
arcing....
A strage thing is that i have the dip with the plate pointing 28mhz and
not 14 mhz as i would expect... the other bands are OK...

So maybe there is a problem in the back section of the band switch but
also a misalignment of something?

Anyway i have cleaned as best i could the back section of the rotary switch
but the position is difficult to reach and maybe i have to dismantle the pa cage
to make a good job , what do you think??

Subject: [TS-520_820_530_830] 1 radio 2 problems!

I am still trying to fix my 820S i have restored cosmetically and now i must fix the
remaining problems.

1) i have low power only in 20 meters 65W instead of 100-110 i have elsewhere. The strange
thing is

that i obtain this power with load very advanced and plate on the 28 mhz position... and 14
mhz is just

28/2 .... strange isn't' it?

I have realigned the tx to peak alc at 14.175 as reported in the manual i have changed
final tubes

the 12by7a and cleaned the band switch but i have still the problem.

2) i have no 100hz reading on the frequency counter at all the last digid is off all the
time , all the other segments works fine.

Some advice?

Mike
I realized I do have a freq counter in my volt/ohm meter. I checked the voltage on the VF AVR,it was 9.2, 9.2 and 3.3. I will check the freq out put from the VFO some time today. Chuck thanks for the input. I am thinking like you on CAR 2. However I'm certainly not a tech. Just a wanta be I guess. If I didn't have you guys helping me I'd be lost. Any suggestion on how to check CAR 2 out put will be appreieciated very much.
Thanks
Rob

>
> Rob,
>
> All of the Kenwood hybrid VFOs operate on a specific range of frequencies. The 520 and 820 VFOs operate between 4.999Mhz and 5.500Mhz on ALL band. The 530 and 830, however, operate between 5.400Mhz and 6.100Mhz.
>
> I assume the VFO tunes smoothly, no jumpy or erratic behavior occurs when tuning the VFO. If that's true then the VFOs working fine. If you have a frequency counter, pull the RCA plug cable from the rear of the VFO and connect the VFO output RCA socket to the frequency counter. Tune the VFO from the low end, 0.0 to the high end 500. The counter should display 5.500Mhz at the low end and 4.999Mhz or 5.000Mhz on the top end of the dial. If it does then, again, the VFO is fine.
>
> Check the 9VDC supply on the AF AVR UNIT. Remove the top and bottom cover, turn the 820 upside down with the front panel facing you. The AF AVR UNIT is located directly below the VFO. The board 2 plugs along the front panel, AF1 and AF2. AF1 is on the left and AF2 on the right. Pins are numbered right to left, 1, 2, 3, 4, 5, and 6.
>
> Connect you DC volt meter to AF1 pin 1 or 2. The voltage should be 9VDC If it is not then adjust VR4, in the middle of the board (not the large plastic pot, that's the RIT pot) so the volt meter reads 9VDC +/- .5VDC.
>
> Next, move the DC probe to pin 6 on AF2. The voltage should be 3.3VDC. If it is not, adjust VR1, located between AF1 and AF2 plug, so the meter reads 3.3VDC +/- .5VDC.
>
> The hybrids have a tendency to have dirty plugs on the PC boards. Also, the pins and plus do not always make good connections which leads to other problems. I had a problem where my 820 appeared, visually, to be working fine but, no receive and no transmit. The problem was one or more of the pins on a number of plugs that were simply not making good contact. I fed the 8Mhz IF signal to the IF board and I could hear it fine but nothing on transmit or receive. I remove all plugs, cleaned them, and put them all back onto their respective pins then ensured all board mounting screws were tight and it worked. I can't say for sure this will fix your problem, just a thought from my experience.
>

> The VFO in ALL of the hybrids are powered from the 9VDC supply. Any instability in the 9VDC supply will affect the VFO's stability.
>
> Drift in the 820 can be traced to the 9VDC supply and typically is caused by aging D5 (6 volt zener) and Q7 (2SA496Y) regulator, both on the AF AVR board. Replacing both D5 and Q7 will significantly improve the drift in the 820. You can find new Q7s at the following website.

> > Thanks much for your help also. I do plan to remove and clean the VFO. However it does tune thru all other bands fine. I guess the last 50 kc of 75 meters isn't a big deal, but it does indicate a problem with that band. I have compared it with my other radios both TX and RX, and do know the 820 does indeed stop at 3.955 It's not just the display. My thought is if the VFO tunes all the other bands completely to the top end the VFO is working correctly. That leads me to think the problem is somewhere else with the 3.5 MHZ band. Any thought ae greatly appreciated.

get 60ma idle IP, but thats it. I cannot get it to trasmit at all in any of those modes (TUN,CW,FSK). Only get idle IP.
> > >
> > > I will remove and clean the boards in the display unit. However the display stopping at 3.950 condition only happens on that band. Works normal on all other bands. As well it does not recieve any higher than the display reads. The reciever stops as well as the display. Again this only happens on this one band.

Another point that I have run into too many times is the little metal terminals inside the plastic connectors get old and the springy part breaks. when that happens, the terminal no longer makes a good if any connection. This seems to be especially true on the 820's for some reason

I have a NOS 6146A that was sent to me by mistake in a 6146B box. Anybody need it? The price is right - free. A couple of bucks to cover shipping appreciated but not required. Note that this tube will not work in a Kenwood hybrid.

Chuck and Rob,

If cleaning the PLL and CAR UNITs does not improve or fix your problem, I recommend checking the alignment of the CAR UNIT. The CAR UNIT alignment is covered in the service manual on page 45. CAR UNIT output level adjustments are measured on the CAR UNIT plug CJ3 pins 2 and 5, .3 volts. You will need an RF probe or o'scope to measure the levels on pins 2 and 5.

The CAR UNIT not only provides the transmit carrier generator signal for all modes but also the "BFO" signal in receive.

The CAR UNIT has 2 boards, CAR-1 and CAR-2.

CAR-1 has 2 crystal, X1 (8828.5Khz LSB) and X2 (8831.5Khz USB)
CAR-2 has 1 crystal, X1 (8830.7Khz CW/TUNE)

CAR-1 provides ALL receive mode BFO signals and USB and LSB transmit carrier generator signals to the IF UNIT. CW, TUNE, and FSK transmit mode carrier generator signals are provided by CAR-2.

As I stated above, CAR-2 provides a carrier generator signal for CW, TUNE, and FSK transmit ONLY. CAR-2 does not provide any receive support signals, only transmit and only in CW, TUNE, and FSK modes.

The FSK jumper placement on pins CJ-1 of the CAR UNIT determines the "initial" frequency "shift", narrow or wide. The actual FSK frequency "shift" is determined by the Jumper placement AND the adjustments of TC-3 for Wide shift (850Hz) or TC-2 for Narrow (170Hz). Again, CAR-2 does not provide anything in receive, only transmit.

It is quite possible a previous owner has improperly adjusted TC-1 on the CAR-2. An improperly adjusted TC-1 can lead to the oscillator not oscillating OR a CW-T signal that falls too close to the edge of the crystal filter resulting in very low, if any, 8Mhz signal appearing at the output of the filter. Very low or no signal at the output of the filter can lead to the problem you are experiencing. A frequency counter connected to TP5 on the IF UNIT will display the CAR-2 crystal frequency. It should be 8830.7Khz on CW/TUNE transmit. If there is no signal at TP5 on the IF UNIT from the CAR-2 oscillator in CW and TUNE mode transmit OR the frequency is way off frequency, adjust TC-1 on CAR-2 of the CAR UNIT until the frequency is 8830.7Khz on TP5 of the IF UNIT with the 820 keyed in CW or TUNE mode. At that point you can then make the appropriate alignment adjustments on page 45 of the service manual.

Remember, you're not the original owner, you don't know what any previous owner has done, and you don't know if any modifications have been done to the 820. A previous owner may have started adjusting caps, pots, etc, not knowing what they are doing which could easily lead up to the problems you are experiencing. Clean the radio then check the alignment, that's the best thing to do right now. At this point, I am not sure any of the crystals are bad on the PLL or CAR UNITs. Alignment after cleaning will determine if any are bad. If you

find one bad you can order replacement from International Crystals in Oklahoma City, Oklahoma.

http://www.icmfg.com/hamradio-manufacturers.html

Sorry for being so long on this but it's important to understand what circuits do what and when. This will help you decide which place to start with and what to look for.

Good point Gordon, I agree. That's what was wrong with my 820 but the symptoms were much worse then Rob's. I lost both transmit and receive on ALL bands and ALL modes. The 820 looked perfect, normal displays, 60ma idling current, etc but no transmit and no receive. It works fine now, must have hit the right plug.

Rob, you're going to find the problem, don't get frustrated.

Hi Mike
No need to be sorry for the length and detail.. This is exactly the input
I need. Thanks very much!
Ok , not having a RF probe I wil try to measure TP5 and see what if
anything I get. Thank you very very much.

Rob,

If you have an all band receiver/transceiver such as an FT-757GX or FT-857D, etc, tune the receiver to 8831.7Khz (8.831.7Mhz) and listen for the CW-T carrier signal. You may have to tune the all band receive a bit to find it. If the 8Mhs CAR-2 oscillator is working you should have no trouble hearing it in the separate all band receiver tuned to 8.831.7Mhz. If you can't find it, tune the separate receiver to 8.831.7Mhz, attach a short piece of wire to the all band receiver and lay the other end close to the CAR UNIT in the 820. Tune the all band receiver either side of 8.831.7Mhz and you should hear the 820's CW-T's signal if the oscillator is working. The 820 must be in CW transmit to hear the signal.

This simple test will tell if the CAR-2 CW oscillator is working in CW transmit. If it is working, you hear the signal, you can also get a ball park estimation of approximately how far off frequency the CAR-2 CW-T signal actually is. Remember, the 820 must be in TUNE or CW mode and in transmit for CAR-2 oscillator to be selected.

I have a NOS 6146A that was sent to me by mistake in a 6146B box. Anybody
need it? The price is right - free. A couple of bucks to cover shipping
appreciated but not required. Note that this tube will not work in a
Kenwood hybrid.

Gordon:

Been thinking of swapping out the 3sk41 's for the nte222 on my ts-520. However the nte222 sells for $12 to $15 each. This seems high to me. Do you have a lower cost source? Also do you need to do some tweaking? Or do you just swap 'em in and good to go?

Hi Jerry,

Use the NTE-222. I use them all the time and they work
perfectly.
I even keep a few in the drawer since they are used so commonly in these
old hybrids.
They are pretty inexpensive too. If you have problem locating some, let
me know and I can mail whatever you need to you.

Paulo,
They are very easy to re-wind.
They are almost impossible to find.
They short out very often due to high Static electricity or a strong close by RF signal.

I have always just swapped them out, done a quick alignment and it's good to go.
I paid $10.00 each for these plus tax.
If I can get over to Fry's electronics, they often have them cheaper. I think it's because they buy in high volume.
Christmas time is NOT the best time to go to Fry's though. It is a ZOO. hi hi. I know I can buy NTE37's from Frys for $3.95 yet my other electronics store gets almost $8.00 for them.
The guy at my regular store told me he can't even buy them from NTE for what Fry's sells them for.

Mike
Ihad a freq of 8829 at TP 5 and when I switched to send it would drop out completely after about 3 seconds. T touched up T 1 and got it back. I now have TUN out put and CW out put! I can tune the PA in TUN mode. I don't have any way to measure the mV at TP 5. The service manual calls for 50 mV. I moved T 1 a few time back and forth and have it just enough from where it was to keep the signal in send. The service manual says to adjust TC 1, TC2, and TC3 to set the freq to 8830.700 and .530 and 8829.850 for FSK SPC etc. I tried to adjust TC 1, 2, and 3, but the freq didn't change. My VOM measures freq, but not down to the .000 range. So atleast I can tune the PA with the TUN mod now, and CW does transmit.
I checked the VFO out put, and it measures smoothly from 4.985 up to 5.505. The 75 meter band still stops at 3.955. I guess I will continue look at that .
Thanks much
Rob

Interesting, I didn't know they still make the 40673,

The 40673 is certainly an excellent mosfet..... I would use that any day. The only real advantage I saw in the NTE222 was its noise figure on higher frequencies. Its made to be used way up to at least 200mhz. For an HF rig the 40673 would be very good.

BTW,

I forgot to mention that I have replaced all 3SK dual gate depletion mosfets in my TS520 (most of them in the receiver). The rf amplifier is now an NTE454 and the mixers and IF amplifiers are NTE222's. Subjectively speaking I notice a lower noise floor on 20,15 and 10M. No measuring equipment available to do a lab test. The radio does sound nice.

My next chore is to upgrade my TS-900s the same way. I bought enough components to do that ...

I feel like I did re-tubing my glow-bug radios,

Greg

Rob,

It is appearing, more and more, that a previous owner has messed up the 820's alignment in both the CAR and PLL units. From the changes in symptoms that are occurring, it sure points to a complete re-alignment may be required. This is not difficult to do. You can do most of it with a frequency counter and a volt meter, at least setting the CAR and PLL frequencies according to the service manual steps. If you have access to an o'scope, maybe a local ham has one, then you can use the scope in stead of an RF probe.

I am, however, some what confused as to what you mean when you say the VFO stops at 3.899. Does the VFO "physically" stop or can it be tuned beyond 3.899? If it can be tuned beyond 3.899, what happens, does the digital display go blank or what? I don't believe there is anything wrong with the digital display or the VFO, at least at this point as you have verified it tunes from 4.999Mhz to 5.500mhz which is the range it tunes on ALL bands and ALL modes. The VFO does not change frequencies when the band switch setting is changed.

IT FIXED ITSELF!

I tried listening again this afternoon, three days after I broke it, and, lo and behold, it's receiving again. I haven't tried the transmit yet, but I'm pretty sure it'll work too.

I wasn't aware that Kenwood hybrids would fix themselves... nice feature!

Sorry to bother everyone. You can be sure I won't be trying that keyer again until I'm sure it's set up for "grid block" keying. I'll have to take off the cover and look around inside since it's a no-name keyer, but I won't use it until I'm sure it's right. Until then I'll just have to learn to use the straight key.

There's also the possibility that the keyer had nothing to do with it. I'm always running into that diagnostic problem when my computers inexplicably stop working. It could still be that the transmit won't run in CW mode for more than a couple of minutes, regardless of the keyer. I'll keep my eyes open for that eventuality too.

Anyway, thanks for listening. This looks like a good, active group and I'll be keeping up on the postings.

Mike
My mistake or mis typing. The 75/80 meter band now will tune from 3.498 up to 4.014. The reciever seems on frq through out the entire band now. All other bands are fine also.. I found the VCO to read 6.000 volts on 80 meters, and 29 mhz also was 6.0. I went by the service manual and aligned the VCO to get all bands to 2.9 to 3.2v. Now that I have a carrier in TUN and CW, I followed the service manual and aligned the ANT and MIX coils as well as the drive coils.
At this point I can tune all bands from top to bottom, TUN and CW work so I can use them to tune the PA. The VFO is MUCH more stable now! After 15 minutes or so it doesn't drift at all that I can tell so far. I put it back on the antenna and it seems to be spot on freq as far as receive goes. I guess when I talk to some of my regulars they will let me know if the transmit is on freq. I think I may need to neutralize the PA, as it acts a little strange on 20 meters. I would think a throrough alignement would be good.. But at this time it's ALOT BETTER than it was!
THANKS FOR ALL THE HELP TO ALL THE GUYS!

I am glad it is working out for you. I have been using my 820 with out the digital display for the last 20 or so years. The only issue I have with it is that once every 4 to 6 years I need to clean the relay and the pots. The rig is almost indestructible. And with the group like this that will help you keep it going you will get many years out of it.

Mike

My mistake or mis typing. The 75/80 meter band now will tune from 3.498

up to 4.014. The reciever seems on frq through out the entire band now. All

other bands are fine also.. I found the VCO to read 6.000 volts on 80

meters, and 29 mhz also was 6.0. I went by the service manual and aligned the

VCO to get all bands to 2.9 to 3.2v. Now that I have a carrier in TUN and CW,

I followed the service manual and aligned the ANT and MIX coils as well as

the drive coils.

At this point I can tune all bands from top to bottom, TUN and CW work so

I can use them to tune the PA. The VFO is MUCH more stable now! After 15

minutes or so it doesn't drift at all that I can tell so far. I put it back

on the antenna and it seems to be spot on freq as far as receive goes. I

guess when I talk to some of my regulars they will let me know if the transmit

is on freq. I think I may need to neutralize the PA, as it acts a little

strange on 20 meters. I would think a throrough alignement would be good..

But at this time it's ALOT BETTER than it was!

THANKS FOR ALL THE HELP TO ALL THE GUYS!

23873. TS-520S Questions

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-10 05:10:35 UTC
From: unnorml
Topic: 23873 Message: 23873

Greetings,

I recently acquired a TS-520S and have been going through it for about 6 months.

The entire setup consists of the TS-520S, VFO-520S, AT-200, SM-220, SP-520, CF5KV Filter, Comet H-422 4-Band Dipole (V-Config).

I've become very familiar with adjusting and operating it in that time and know both the operator and service manuals quite well by now.
It's working great but I have a few questions regarding a few topics.
I'll make the questions simple in hopes of receiving simple answers.
The last questions relate to other accessories.

1) When adjusting the DRIVE when tuning, do you adjust to max ALC (S9, 225ma), or adjust to max deflection (maximum reading on entire scale)?

2) Is low receive sensitivity on 10m normal along with the known low output? Just curious about this one.

3) Has anyone successfully made the modification for the IF♯2 Output for use with the SM-220 BS5 Pan Adapter? How did you get to the Q4 transistor?

4) I have come across different power readings between the AT-200 Tuner and my Bird Model 43 Wattmeter. I have connected the Tuner and the Meter separately and in series with each other (Tuner->Meter and Meter->Tuner). Has anyone seen this and how did you address it?

I'll say that this site is wonderful and the opportunity to gather information from "everyone" is appreciated. Also a great tool for the curious and the frustrated alike.

73,

Mike - KI4FDH

23874. 20 meters low power

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-10 08:16:39 UTC
From: Andrea Liverani
Topic: 23874 Message: 23874

Again about my ts-820S.

I have low power in 20 meters just 65W instead of 85-90 i have for example in 15 and 10 meters
or 110-120 i have in 80/40 meters.
The tubes are OK. the 12by7a is ok.

A strange thing is that the dip for plate is obtained with the control in the 28 mhz position and
with the load quite advanced clockwise . IF i switch to 15 meters the plate is dipped perfectly
in the 15 meters section of the scale so it is not an incorrect positioned indicator.

Another thing is that i can ear some noise from the tubes when trasmitting on 20 meters, like
something si arcing sometimes in the PA tank. If i move the bandswitch i see oscillations in the power.
I have cleaned the bandswitch but still have same prolems... i think there is something wrong but
only in 20 meters position because all other bands works fine.
Some suggestion for troubleshooting?

Hi again
Just a slight problem with the 830S. In the 'tune' position the relay comes in and then drops out again in under 1 second - no chance to tune and load. The VOX gain and delay do not alter anything when in 'tune'. So the only way I can tune is with key down. Is there any way I can increase the delay on 'tune'?

From: Greg Anders
Topic: 23874 Message: 23877

Hi Andrea,

It is definifitely not good that your plate dip occurs in the 28mhz segment. It sounds like the finals are tuning up on the second harmonic not the fundamental frequency.
Did you try to move the plate tuning to a position slightly lower than the 20M segment to see if there is a dip below the 20M segment/ point we would expect the dip?

Hi Jerry,

I am a little confused when you say:
"I left the heater switch off, checked the plate idle current,
changed the mode switch to TUN, checked ALC, changed mode switch to
CW, flipped the "tune" toggle switch on the keyer to close the
contacts, dipped the plate, all okay. Then I turned the "tune" toggle
off and began practicing with the keyer."

With the heaters OFF, you should not have any idle current, ALC, or
be able to dip the plate current. If you were able to do all of
this, I suspect there is a problem with the heater switch.

Jay,

I just went and tried it and you're right. I must have had the heater switch on up through the "dip the plate" step. Then I turned it off and started practicing with the keyer.

Sorry about that. I'm still learning this stuff. Thanks for the correction.

From: w5rkl
Topic: 23835 Message: 23881

Jay is right. Heater switch OFF, the driver and both final tubes do not conduct which leads to no ALC in TUNE mode, no 60ma idling current, no dipping of the IP current, and no RF output.

Next, the keyer itself did not damage the 520.

The receiver front end appears to be working otherwise the calibrator signal would not be heard. My initial suspicion is the antenna change over relay between the final amplifier and the rear panel.

To check this relay, remove top and bottom covers, turn the 520 upside down with the front panel facing you, and look at the left rear. Notice the small metal enclosure between the final amplifier and the rear panel. Remove the 2 screws holding the relay cover in place and remove the cover. Gently pull the relay from it's socket.

Gently remove the relays plastic outer cover.

Cut a strip of bond paper and wet it with contact cleaner. Slide the strip of paper between the relay contacts, repeating this step a number of times with new paper strips wet with contact cleaner until the paper strip no longer turns black. Do this to both side of the 4PDT relay contacts. You will have to manually press on the relay's armature. Just be careful not to damage the relay or bend the contacts. Once cleaning is completed, use canned air, available at Walmart in their computer/stereo section, and remove all residual cleaner and dirt. Reinstall the relay and test for operation.

Try this first before attempting anything else. If your technical troubleshooting and repair skills are lacking then I recommend locating a local ham who has the skills to do this otherwise you could damage the T/R relay and create more problems in your 520 than you already have.

I forgot to include this question in my last response.

Was the "VOX" switch set to "ON"? If so then the 520, in CW mode with a CW key plugged into the CW socket and the CW key closed (pressed), the 520 would enter transmit mode!

Hi Paulo,
If I remember correctly, the primary is 6 turns and the secondary is 27 turns.
I have a good one here, but I really don't want to take it apart and count the turns. I'll wait until I get a burn one again. hi hi

I want to thank everyone for the response to the VFO 520/820 Cables that I have offered for sale. They are selling out quickly and I only have around 5 left now.
I also still have a few of the 9 Pin shorting plugs for the 520 820 Radios.
I am also now making and selling the VFO-240 VFO-230 cables for the TS 530, TS-830, TS-130 etc etc

Thanks,
Gordon

Hi Andrea,

Note the IP and HV on 15m then do the same on 20m.
Higher current and lower voltage on 20m may indicate arc shorting.

Peaked in TUNE, what's the output on 20 and what are the settings? (load, plate, drive)

Do you ever have your radio on? On the QRZ page you state that you are on 14.243 are you still? Also would you be against a local in need of help and suggestions dropping by and showing you a rig then picking your brain. Maybe it could be done over lunch?

Hi Bob,
Yes, I do have the radio on. I must confess, I don't get on 14.243 as much as I used to. Lately been doing more repairs and building then I have been operating.
I do get on 14.218 every Thursday Morning at 1600UTC (9AM Pacific time) with a couple of good friends for an hour or so.
Please tell me more about this rig you need to pick my Brain over .

OK! I GIVE...

Just spent an hour looking at K4EAA's website and he says to just email him with questions about shipping, or purchasing "other parts" not shown on the website etc. Only problem is... I can't find any eMail address to send my questions to him and the web listed phone number wasn't answered...

I need:

2 ea of the PG-200 panel fasteners for the TS-520
1 ea of the filter select knob for the TS-440

Can anyone help?

Either a phone number (1 941 925 7222 rang and rang), or an email address would be appreciated.

OH... if you have the parts, let me know that too.

The question is about the Kenwood Twins 599 early version. I have the Receiver working very well. The Transmitter need a lot of help and just by looking at it you may be able to tell me if it is worth the time and effort. It is a rig that was working when I loaned it out but when I got it back 3 years later it was smoked. It is not that big of deal but for me to have someone look at it physically and see the damage with recommendation on where to start as a minimum it would be a big help. I also did not get back the connecting cable so I will either need to build a new one or pick one up? I havent begun to look at all the parts that will need to be replace. New tubes even though they test ok? resistors that have split from age, tuning wheels that the rubberbands have cracked and frozen need to be replaced with new, or updated to new metal chain type tuning styles that can handle the heat? Coils that are fried or melted? This will be fun to get back on the air but $$ could be an issue if it is going to cost a ton of $$.

Bob,
You are going to regret NOT getting the connecting cable back. The Connectors appear to no longer be made. I do have the wiring schematic for the cables, but Hirose <sp> no longer makes those connectors. They do make something similar, but you would have to change the mating connector in each rig as well to match the cable. If I recall correctly, they are 16 pin connectors.
No one, that I am aware of, has ever been able to find a used/replacement cable.
Resistors are No problem to find and replace. Melted Coils could be a problem.
I would be happy to take a look at it with you, but I do have a very busy schedule right now, especially with the Holidays right around the corner. Maybe we could do it after Christmas?
I also have a SteppIR that I need to do some work on and then there is the rains coming etc etc etc.. hi hi

I am not going to worry about what I did not get back. To go ask his widow to go through all the junk now would be very bad taste. This man was a dear friend of mine for close to 30 years and a Ham Radio Operator for over 40 years. He helped me many more times than I could ever count. He just needed some extra help the last few years he was with us. I will look into finding the connector ends and I think I saw the cable diagram or schematic for the cable in the service manual so if it needs to be modified or reproduced with different style ends to make the rig work so be it. Have you been to Ford Electronics in Fullerton? Sometimes Scott Ford and his brother come up with some stuff that the other outlets cant find.

After the first of the year would not be any issue at all.

Antenna issues, I just rebuilt a 25 year old KLM rotatable dipole it is 45 ft long. And I have a 80 Ft telescoping tower that is in need of being put up so I can put the 6 element KLM back on the air as well.

Projects what would life be with out them?

I have a IRLP node # 3551 here locally and have 2 mtr SSB on 4.200 as well as winsystem on most of the time, along with the HF. I could work you simplex 2 mtr, 220, 440, or 6 mtr

I could also drop by and help you work on that SteppIR if you need a extra hand. I am not as young as I used to be but I still can handle a wrench with out dropping it. Nuts and bolts that is a different story.

Gordon right now I am out of work so M-F I could help as well.

Bob, & Gordon,

The 599 interconnect cable does show up from time to time on eBay... The last one sold on Dec 3rd, for a whopping $97.67, +$7.15 s/h. A few months ago I saw one go for over $100. So, if you are willing to spend that much, you might want to set up a saved search to email you when one goes up for auction. You won't know how it will be described, so I would suggest searching on "Kenwood (T-599*, R-599*, Twins)", or something to that effect.

Sorry, mine's in use! Not selling it (yet)!

Cheers & 73,
Chuck WA3CEJ

From: Andrea Liverani
Topic: 23874 Message: 23896

Hi, absolutely no sign of dip (or power) except than 1 dip in 28 mhz segment. I also supposed that i am tuning the second harmonic.
The radio is also instable in 20 meters i an see some arcing in the PA section of the band switch if i turn the load control slightly counterclockwise
from the point of power dip. It is also strange that load control is dipped so advanced clockwise in respect of the other bands....

Hi Andrea,

It is definifitely not good that your plate dip occurs in the 28mhz segment. It sounds like the finals are tuning up on the second harmonic not the fundamental frequency.

Did you try to move the plate tuning to a position slightly lower than the 20M segment to see if there is a dip below the 20M segment/ point we would expect the dip?

Greg

To: ts-520_820_530_830@...m

Subject: [TS-520_820_530_830] 20 meters low power

Again about my ts-820S.

I have low power in 20 meters just 65W instead of 85-90 i have for example in 15 and 10 meters

or 110-120 i have in 80/40 meters.

The tubes are OK. the 12by7a is ok.

A strange thing is that the dip for plate is obtained with the control in the 28 mhz position and

with the load quite advanced clockwise . IF i switch to 15 meters the plate is dipped perfectly

in the 15 meters section of the scale so it is not an incorrect positioned indicator.

Another thing is that i can ear some noise from the tubes when trasmitting on 20 meters, like

something si arcing sometimes in the PA tank. If i move the bandswitch i see oscillations in the power.

I have cleaned the bandswitch but still have same prolems... i think there is something wrong but

only in 20 meters position because all other bands works fine.

Some suggestion for troubleshooting?

Mike

With the switch to 'send' and mode the mode switch to 'tune' then it is OK and the relay doesn't drop out.

With the switch to 'rec' and the mode switch to 'tune' the relay comes straight in and drops straight out. Also, the Vox gain seems odd. With it set at very minimum gain it still activates the rig when keying.

Cheers

Hi Dave!
In 15 meters i have 90 W , plate control perfectly centered in the 15meters section load just above middle scale and tune in the middle of the scale (alc maximum deflection)

In 20 meters i read 60-70W plate contro in 28 mhz section , load quite fully clockwise and tune in middle scale.

IC is about the same in both bands... 220-230 ma and HV is about 800V .

I have observed tubes and pa compartment in the dark and i can see some arcing if i move the load control counterclockwise in 20 meters, I have seen the same arcing inside one of the tubes (the one neat the back of the radio). If I advance load again arc disappears.

I think all is related on the wrong position of the plate control where i have the dip that is in the 28mhz segment and not on 14mhz.

Thanks

Hi Andrea,

Note the IP and HV on 15m then do the same on 20m.

Higher current and lower voltage on 20m may indicate arc shorting.

Peaked in TUNE, what's the output on 20 and what are the settings? (load,

plate, drive)

Vic,

If VOX is turned ON and you change the MODE switch to TUNE or any other mode for that matter, the 830 will momentarily switch to transmit then back to receive. This is caused by the making and breaking of the MODE switch wafer switch contacts creating electrical noise that is picked up by the relay amplifier, energizing the relays momentarily.

To prevent this from happening, keep the VOX switch set to "OFF" until you are ready to use VOX. This same thing happens on my TS-820 if I forget and leave VOX turned "ON".

Remember, CW break-in required VOX to be turned "ON". If VOX is left turned "OFF" in CW mode, CW break-in will not work. CW break-in is when the MODE switch is set to "CW" and VOX is turned ON, the 830 switches to transmit "automatically" by closing the CW key. The CW sidetone activates the relay amplifier through a portion of the AF UNIT's VOX circuit, same as though you spoke into the microphone with VOX turned ON and set properly, the 830 would switch to transmit when you speak into the microphone.

Have you checked the band switch coupling(s)? They may be cracked which can lead to the wafer switch being out of alignment.

I also would check each bands wafer switch, including the wafer switch in the final amplifier, to ensure it is making good contact. This means to not only visually inspect the switch but look closely as the wafer switch moves from contact to contact. A wafer switch that is making contact will show the "fixed" contacts rise as the moving metal wafer slides between the fixed contacts. If the fixed contact do not rise when the wafer slides between them then it's possible the fixed contacts are not making contact with the sliding wafer.

Andrea,
What are the settings and results in TUNE mode?
(Don't rock the band switch during Tx)
If you get around 20watts with 'normal' settings, then the basic band setup
is ok.

Can you check the CW output frequency on 20m? (look for harmonic on 10m)

Hi i get about 15-20W in tune without arcing but with same plate setting than in CW (plate in 28mhz zone) i send you a small clip on youtube showing arcing and innatural settings
in 20 meters. I have tried for armonics if i transmit on 14175 i have strong armonic exactly at 28.350
if i transmit even with 1W o have full scale deflection on receiver. I ham trasmitting on two bands!!!

http://www.youtube.com/watch?v=I3mU8T24VE4

A friend of mine told me that is possible that the bandswitch maybe switches also some condenser
in the pa stage prom bands to band and maybe one ore more condenser are bad and so me have this problem...

i don't know what to think because it's the first time i see such a problem.

Hi All,

I hope to get my station --- a TS-830S and Tokyo Hypower HC-200 tuner and a horizontal loop for 40-20-17-15-12-10 meters --- set up soon after Christmas. I wonder if I need an external VFO for DXing or if I could just use an external receiver tuner to the split frequency instead. What do you folks think? Someone suggested this on a forum at eham, so that's why I'm asking.

TIA,
Roy Kersey

Thanks for your help Mike. The VOX is off. And since this incident the TS-520s has started working again, both receive and transmit. In fact, I've made two QSO's using CW this week... and learned just how poor my own CW skills are... but that's another story.

You gave some very good advice on the T/R relay and I will keep that in mind for the future. But right now I'm just happy to have a working rig again. (Though I still can't figure out why it quit working for several days, then came back again...???)

Thanks to everyone for your responses. I'll be checking this forum frequently for good suggestions on caring for and using these workhorse tranceivers.

OK Andrea,
Thanks for the video! Very clear.

I see that you have your rig meter set to RF.
Was it set to IP when you measured current?
Are you using a good dummy load?
Your readings indicate a nice rig that just needs some TLC.
Yes, the bandswitch does switch capacitors in the pi-network and it looks like Mike's recommendation is the way to go. Work safely! Use the schematic.
Check that each rotor lifts the fixed contacts as it passes through them.
Check the couplings for movement.

Gordon knows the these band switches backwards and has posted excellent photos on the group site.
I'm sure that Gordon and Mike will help if you need guidance.
Good luck.

Hi the RIT/XIT gives you about +/- 2Khz which should cater for most needs but the use of 5 Khz as a split is becoming more common of course.I think somewhere on net is mod for increasing the RIT XIT spread and that should be all you need.
Cheers Pete

Subject: [TS-520_820_530_830] Need external VFO??

Hi All,

I hope to get my station --- a TS-830S and Tokyo Hypower HC-200 tuner and a horizontal loop for 40-20-17-15-12-10 meters --- set up soon after Christmas. I wonder if I need an external VFO for DXing or if I could just use an external receiver tuner to the split frequency instead. What do you folks think? Someone suggested this on a forum at eham, so that's why I'm asking.

TIA,
Roy Kersey

Unless you do a lot of DX split operation, more than likely you will not get much use from an external VFO. I have an 820 with the VFO-820 and 95% of the time I never tune using the VFO-820.

I personally would not modify the 830's RIT/XIT to increase the frequency change. If you go to that extreme, it would be safer and easier to simply purchase a VFO-230 or VFO-240, no modifications required.

As for using a separate receiver, antenna change over and muting circuits would be required. A better idea would be to find and purchase a good set of Kenwood 599 twins. That would solve everything. Keep the 830 of course.

  Usubg the ext VFO is a lot more economical than buying another receiver. Modern rigs all seem to have a 2nd VFO built in. Tghis is for split freq operation.
I have never operated split but DX stations seem to do lthis often.

Hi All,

 I wonder if I need an external VFO for DXing or if I could just
use an external receiver tuner to the split frequency instead. What do you

23913. Slow T/R relay

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-12 14:39:10 UTC
From: Peter
Topic: 23913 Message: 23913

Hi All, I've been following the problems that have been mentioned about the T/R relay. When I release the mike it takes several seconds to go to receive from xmit. I have checked using VOX to see if it is my MC-50 that is the issue and the results are the same. As a fisrt step to resolve this should I clean the the relay contacts? Any other suggestions such as adjustments that can be made? The previous owner used PSK31 as his principle operating mode.

Thanks,

Pete, N1TCH

Yes i know quite well how this radios should work
i have also 520S 520SE and 830M so i understand my radio behaves
incorrectly.
All my radio have smooth tuning and perfect alignment except this 820s.
I had also to completely restore the exterior because it was a smoker's
radio and it was abused very badly.. so i have washed all knobs and frontplate
and panels in my bath tub and i made brown water because it was really full of nicotine.
Then i repainted in exact color and finish the radio , the outer speaker and vfo.
Cleaned the inside (that was a lot better) and lubed it.
I have reconstructed the filter inside the external SP-820 because the previous owner
has dismantled all of them and just connected speaker to rear rca connector.
I have repaired the digital display that was dark (except the 100hz digit that is still not working)
changed 1 transistor, and two diodes because the previous owned made a short circuit trying to rewire the external vfo cable.
And every thing i fix i love more this phenomenal radio now we are at the last step....
Anyway i payed just 120$ for the whole line so i cannot ask more .... even if it was ready for the
dust bin and mine was the only offer on ebay ...

Subject: Re: [TS-520_820_530_830] 20 meters low power

OK Andrea,

Thanks for the video! Very clear.

I see that you have your rig meter set to RF.

Was it set to IP when you measured current?

Are you using a good dummy load?

Your readings indicate a nice rig that just needs some TLC.

Yes, the bandswitch does switch capacitors in the pi-network and it looks

like Mike's recommendation is the way to go. Work safely! Use the schematic.

Check that each rotor lifts the fixed contacts as it passes through them.

Check the couplings for movement.

Gordon knows the these band switches backwards and has posted excellent

photos on the group site.

I'm sure that Gordon and Mike will help if you need guidance.

Good luck.

Topic: 23906 Message: 23917

if you put your hand on a vfo-230 you get a very valuable objects. You get a very smooth tuning, (with a small mod on it just cutting some resistors)
you have a tuning three times smoother than original vfo so you can use digital modes easily. The vfo 230 has an optical encoder so it is a step further
in respect of the original enclosed vfo. You also get memories on your ts-830 and you can use it for setting 5 7.5 10 khz split for immediately qsy during pileups.
And vfo-230 has a separate display to show it's frequency. Is like having to radios at the same time , just without simultaneous listening.
For me is the best accessory you can add to a ts-830 and with vfo-230 you get a terrific dx machine. The problem is that vfo-230 is quite difficult to find.

Another query. The drive control peaks the Tx but has a different setting for the Rx. I assume that the drive control is another name for pre-select and should come together on both Tx and Rx. For example, I can peak the calib sig but have to alter the setting to peak the IC. Maybe this is the norm but in my experience they should both line up together.
Or, is it just what it says 'Drive' and no connection with the RX.
Sorry to be a drag but it's nearly 30 years since I had one of these and I haven't learned to drive it yet!

Trav,

Something else to check for on the relay(s) is an intermittent connection between the contact reeds and the base pins. They appear to be tightly sandwiched togegher, but may not be electrically connected. I had one fail in my 820s. A tiny bit of solder solved the problem.

> > To check this relay, remove top and bottom covers, turn the 520 upside down with the front panel facing you, and look at the left rear. Notice the small metal enclosure between the final amplifier and the rear panel. Remove the 2 screws holding the relay cover in place and remove the cover. Gently pull the relay from it's socket.
> >
> > Gently remove the relays plastic outer cover.

> >
> > Cut a strip of bond paper and wet it with contact cleaner. Slide the strip of paper between the relay contacts, repeating this step a number of times with new paper strips wet with contact cleaner until the paper strip no longer turns black. Do this to both side of the 4PDT relay contacts. You will have to manually press on the relay's armature. Just be careful not to damage the relay or bend the contacts. Once cleaning is completed, use canned air, available at Walmart in their computer/stereo section, and remove all residual cleaner and dirt. Reinstall the relay and test for operation.
> >
> > Try this first before attempting anything else. If your technical troubleshooting and repair skills are lacking then I recommend locating a local ham who has the skills to do this otherwise you could damage the T/R relay and create more problems in your 520 than you already have.

Hi Scott,

For what it's worth, I started in PSK using the 599 Twins and an experimental breadboarded interface to pad the soundcard output to an appropriate level for the mic input, and a direct connection from the speaker output to the soundcard input. It worked out surprisingly well! Just tune to 7035 (or the digital sub-band on any other band), USB, wide filter, and let the waterfall do the rest... Later I upgraded to a TS-440 with a cleaned-up interface and rig control which made things more automated, but there was never a problem with the Twins making contacts (except the lack of the 30m band!).

GL with the PSK...

Cheers, & 73,

I have a TS 530SP
I use it on PSK 31 all the time. The 530 has the digital freq. display so it makes it eaiser to get on freq. I use the rigblaster plus with the 8-pin to 4 pin adapter and a ps231 to usb adapter and it works flawlessly. When you tune up keep the carrier all the way up, and adjust your output with the mic gain. Also when you tune up you do not want any ALC on the meter. Run your rig at 50% or less power to keep your tubes happ HI HI. Keep an eye on your output so you do not splatter your signal.
Hope this helps.

Scott,

The 520 can adapt quite well to PSK. Simple make the TX and RX audio connections to the rear PHONE PATCH IN/OUT sockets on the rear panel. You could use VOX and not have to be concerned with PTT.

The main issue is stability. The 520 has an analog VFO that can and will drift even after a 30 minute warm up. It all depends on how much your 520 drifts. The main source of drift in the 520 is the 9VDC supply on the FIX CH AVR board. As long as the 9VDC supply is stable the 520 will remain stable. As the 9VDC supply drifts so does the VFO which leads to the 520 drift.

Try http://home.att.net/~n8st/kenwood.html

I bought one of these for my TS-820, and it was VERY simple to hook it all up. Plug and Play!! Documentation provided gave complete hookup instructions. Wires were color coded so there was no guessing which wire went to which line on the computer. Does it sound simple? It was! Only thing, my TS-820 is not real stable with just a little frequency drift which made PSK a little more difficult than the newer solid state rigs. It was still very easy to hold PSK QSOs, but you had to pay attention to whether the radio was drifting or not. I think the interface cost me $40.00 or so. I was very happy with the purchase. Also it has about 6 foot cords on it each way, to the radio and the computer, so there is plenty of hookup line, just in case your radio and computer are not right next to each other.

There is quite a difference between a TS-520 and a TS-530, especially in frequency stability. The stability in the 530 is much better than in the 520 due, in part, to the method used to produce the operating TX frequencies and the processing of incoming RX signals. This leads to a much more stable radio in both TX and RX in the 530 verses the 520.

This is a followup to my original post back on November 19. The problem with my TS-830 has been resolved thanks to the information posted by Wim, PA0PGA. He suggested that the blown cathode resistors could be caused by a leaking ceramic disc capacitor on the final board (C1 - 100pf/500v). I replaced that capacitor with a 100pf/1kv unit and sure enough, no more blown cathode resistors. Many thanks to Wim and the others who offered help with resolving this problem.

Happy Holidays and 73,
Tony (N2ATB)

Topic: 23915 Message: 23931

If this is the Kenwood DC to DC converter to allow the 820 to operate mobile from a 13.6VDC source then it is not a DC-2 but rather a "DS-1A DC-To-DC Converter". The DS-1A will work with either the TS-520S/SE or the 820/820S. The original TS-520 already came from the factory with a DC-to-DC converter mounted on the rear panel. Kenwood made the DS-1A DC-to-DC converter an optional accessory for the TS-520S, TS-520SE, and both TS-820 models.

Scott,

after reading Howard's response, I knew that I should have included similar content in my first reply! I agree 100% with his comments about adjusting the mic gain -- No ALC at all, no more than 50% power. I used to run the T-599 at 20-40% power.

Stability was never a problem on my R-599 (it was never powered off), but as Mike pointed out it could be an issue -- but an issue that you can work with. Not sure about other PSK software out there, but the package I use has AFC in the audio processing (I use WinWarbler, included with the DxLab Suite -- FREE!), and it will "follow" a moderate amount of drift.

Go for it Scott, it's a fun mode with lots of opportunity for DX, even with a modest station and antenna. Hook it up, try it out, and post your questions here!

Cheers & 73,
Chuck WA3CEJ

Subject: [TS-520_820_530_830] TS-520S Operating PSK31

I have a TS 530SP
I use it on PSK 31 all the time. The 530 has the digital freq. display
so it makes it eaiser to get on freq. I use the rigblaster plus with the
8-pin to 4 pin adapter and a ps231 to usb adapter and it works
flawlessly. When you tune up keep the carrier all the way up, and adjust
your output with the mic gain. Also when you tune up you do not want any
ALC on the meter. Run your rig at 50% or less power to keep your tubes
happ HI HI. Keep an eye on your output so you do not splatter your signal.
Hope this helps.
73'S and see you on the waterfall

If you replace Q4 (2SC373) and D3 (6 volt zener) the stability of the 520 will be significantly improved.

The 520 has the same basic 9VDC circuit the 820 has. The circuit is the same but the components are different. I have an 820 that had quite a bit of drift. I replace the regulator transistor and zener diode. Afterwards the 820's drift was significantly less, well within factory specs.

I'm not trying to discourage you from operating PSK with your 520. I'm simply providing you with information you may not already have been given in response to your question.

YES THE DRIVE AND RECVR PRESELECT TUNING ARE ON ONE SHAFT. ALIGNING THE COILS ON THE BOTTOM OF A ts520 PER INSTRUCTIONS IN SERVICE MANUAL WILL STRAIGHTEN EVERYTHING OUT.

Mike
Another query. The drive control peaks the Tx but has a different setting for the Rx. I assume that the drive control is another name for pre-select and should come together on both Tx and Rx. For example, I can peak the calib sig but have to alter the setting to peak the IC. Maybe this is the norm but in my experience they should both line up together.
Or, is it just what it says 'Drive' and no connection with the RX.
Sorry to be a drag but it's nearly 30 years since I had one of these and I haven't learned to drive it yet!

I run a 520 SE for psk31 with no problems at all. Don't use the mic socket.
Use the phone patch sockets on the rear of the set. Tune for full power and
then
keep Ip at just over 100mA by using the mic control when you transmit. Use
AF gain to control the waterfall. This will give you about 35 watts out
which is plenty. Don't use the processor and N/B must be off. The only time
I get drift is if Ip is set too high on transmit.

Hi Guys. Having written a few emails about this subject in the last couple of years, I decided to create this document to more easily share this method of checking frequency drift in transceivers and receivers.

What you need:

A transceiver or receiver to test of course.
A computer with a sound card.
A way to get audio from the radio to the sound card. See the text below.
A PSK31 program. I use Digipan.

You can measure the amount of drift that you have in the following manner:

If you are set up for PSK or other digital mode operation. connect your interface. If not, you can connect a cable from the headphone jack on the radio to the line in on your computer sound card, or even just place mic connected to the computer sound card near the radio speaker. I have also placed an ear bud (connected to the headphone jack of the radio) next to the mic on my ancient laptop (this would probably work with about any mic connected to the sound card of any computer).

Tune the radio to WWV, and start your PSK software. I use Digipan. Tune the VFO so that you see the WWV carrier on the waterfall display. You may have to adjust the mixer input controls on the computer, and the AF gain (volume) on the radio. Click on the center of the carrier, and write down the time and the audio frequency shown in the program. Check again at 15 minute intervals, and write down the time and audio frequency. The difference in the audio frequency is the amount of drift. After about 20 minutes or so, the drift should be minimal(50Hz or less in any 15 minute period after warm-up)

Since WWV is a frequency standard, what you are seeing is the VFO drift (and and drift in the sound card if any).

I have used this method for years. It is pretty accurate. How do I know its accurate? Well, the results agree with the results measuring transmit frequency with a frequency counter. A frequency counter is not always available. My Kenwood TS-530S drifts about 100 HZ per half hour after warm-up. My Kenwood TS-130SE drifts about 27Hz per hour, which is very good for a radio with a mechanical VFO (not PLL synthesized frequency control).

Older radios with mechanical VFOs will experience frequency drift. In any of the older Kenwood radios that I have owned, this has always

been within the radio's specs, and has not been a problem for
PSK31/SSTV/digital mode operations.

Douglas-

Look on page 45 of the service manual - it gives a list of everything required to perform all of the alignment tasks. The bare necessities would be a VOM that read to 1000V, a scope and a counter. If you get the DG-5 digital readout for the TS-520 you'll have a built-in counter.

Surplus Tektronix scopes can be had very cheaply on eBay. I got a 100 MHz dual trace for $100.

As you get to know the 520 you can increase your test equipment. Work on upgrading your license so you can take advantage of all the bands. As a past ET you should not have any problems - it all comes rushing back once you start.

23946. audio transmit gain on ts 820 low

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-14 17:18:43 UTC
From: j_52_cooper
Topic: 23946 Message: 23946

I have a condition on my ts 820s whereby I seem to need more and more audio gain on transmit in order to achieve full output. At present the gain must be turned almost to "8" whereas it seems years before it was much less, say 4 or 5. Note that if I run a carrier signal only there is plenty of drive, but when I switch to mic there needs to be considerably more gain. Any ideas?

Joel/ nb9n

23947. Re: audio transmit gain on ts 820 low

From: w5rkl
Topic: 23946 Message: 23947

How are you measuring full output in sideband verses CW (a watt meter or the 820's RF meter setting)?

If it is a watt meter, is the watt meter an average watt meter or a PEP watt meter.

If it's the 820's RF meter setting then the meter displays simple rectified RF voltage into a DC voltage that is applied through the rear panel's RF level pot to the meter. The RF meter setting simply displays a "relative" level of RF at the rear coax connector, nothing more.

Is the microphone you are using a high impedance microphone (50K or higher) or a low impedance microphone (5K)? Have you also tried other high impedance microphones to compare the differences?

Hi Folks,

Here is a way to measure drift - no equipment or technical knowledge needed.

Promise me you won't laugh !! !!

To check - (say) on 20 Metre Band. Switch on '25KHz' on the VFO knob. Tune the rig to where the Crystal Osc gives you a Signal (lets say at 14.000) Ask the wife or kids to keep hitting 'middle 'C' on your Piano, Organ or Keyboard, and tune the tuning dial until the same note is coming from your rig. Turn down the AF Gain - take the dog for a walk - have a cup of coffee, and 30 mins later turn up the AF gain and see what note your rig now matches with. Look up the notes frequency on Google, subtract the lowest from the highest, and VOILA! Thats how far your rig drifted in 30 mins. Easy Peasy !! (Middle 'C'is 440 Hz by the way !!).

I don't know if it works or not, but I just read this thread and thought of it !! Thats the way your brain works at my age (I used to have 'Premature Senile Dementure' - I am much better now, as I just have 'Senile Dementure') !!

Seasons Greetings to All, vy 73's de G3OBU,

John

Topic: 23950 Message: 23950

Hi All,

I wonder, just wonder - Is anyone using a program called 'MULTIPSK' ?

For the moment, I am just trying to get it to work on receive - with the connection from my Loudspeaker Socket into the Mic Socket on my Computer. I get nothing on CW, or on PSK, but do get a string of 'Garble' on RTTY. (I have also tried the 'Lene in')

Years ago, I used to use a 'Commodore 64' (Before PCs came out!), and had a great program that I could Tx and RX with (and do SSTV), and it all came on one 720K Floppy!

I get the 'waterfall, and spectrum graphs, and have tried moving the cursor on to every 'peak' - but Nada, nothing, zero, zilch!

Is anyone else using any FREE software that is simpler to use that I can also use without a TNC or Modem ?

Thanks in advance ....

John G3OBU

John,

You could try DxLab Suite (free download at www.dxlabsuite.com). It consists of individual components for logging, callbook lookups, propagation forecasting, award tracking, rig control (not applicable to hybrids!), eQSL & LotW submissions, and the part you may want, WinWarbler for RTTY and PSK (31, 63, and 125). None of the components require any other component... Support directly from the author via the Dxlab Yahoo group is superb!

I used this suite with my 599 Twins using just simple connections to the soundcard (some padding of signal levels (both ways) was required).

I haven't used multipsk, but have worked many who do... Apparently it does work! But maybe WinWarbler will be more to your liking. If you have any questions about, feel free to contact me off-list, or reply here...

Cheers & GL,
Chuck WA3CEJ

Subject: [TS-520_820_530_830] RTTY & CW Reception

Hi All,

I wonder, just wonder - Is anyone using a program called 'MULTIPSK' ?

For the moment, I am just trying to get it to work on receive - with the connection from my Loudspeaker Socket into the Mic Socket on my Computer. I get nothing on CW, or on PSK, but do get a string of 'Garble' on RTTY. (I have also tried the 'Lene in')

Years ago, I used to use a 'Commodore 64' (Before PCs came out!), and had a great program that I could Tx and RX with (and do SSTV), and it all came on one 720K Floppy!

I get the 'waterfall, and spectrum graphs, and have tried moving the cursor on to every 'peak' - but Nada, nothing, zero, zilch!

Is anyone else using any FREE software that is simpler to use that I can also use without a TNC or Modem ?

Thanks in advance ....

John G3OBU

23952. TS-820 Power Transformer

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-15 01:40:31 UTC
From: trippkj4bkd
Topic: 23952 Message: 23952

Hello to all on the group.

Checking AC power at the 800v side of the transformer, what voltage should I be reading?

I have been told that it should be at least 1000v.

Should I check with the rectifier board disconnected from the 800v side of the transformer and the high voltage Cap disconnected from the 0v side of the transformer?

Checking this way only yeilds 340v AC with or without the wires attached.

It was bear to put in and I have double checked to be sure I haven't wired the 220v,110v switch wires backwards which could cause about half the voltage to be read as I understand.

I appreciate any help with this.

Tripp

Hi John,

I find that Digipan works well for bpsk31. Most of the Gremlins seem to live in the PC sound card. Disable all inputs and outputs that your not using and make sure that any sound card effects are off. If you're running a laptop make sure the on board mic is turned off. The sample rate needs to be set at 11025

23954. Screeching Reception

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-15 07:33:27 UTC
From: kshitij mathur
Topic: 23954 Message: 23954

Dear all Seniors

Since last few days I am observing that whenever I try to tune my TS520SE to a signal on 20 Mt band- I receive screeching signal just few kc up and down of the exact frequency- once I hit the exact frequency then I hear an intelligent signal- but if I shift a bit here and there the signal becomes screeching- what could be he problem?? I am worried specially because This is the only rig I have which keeps me connected me with rest of the world.

This phenomenon is less on 40 mtr band but prominent on 20 mtr. with most of the incommming signals.

Does that mean my anteena is not correct (I checked with 20 Mtr short Beam as well as with Dipole) OR people have started using different technique for transmitting ?

Please Help.

Hi John. I suspect that you have a large impedance and sound level mismatch! Try connecting the headphone jack on the radio to the line in on the sound card. You will have to also try setting the levels both with the radio's AF Gain, and with the computer sound card line in level control.

I like Digipan, but there are several free programs that you can try. FLdigi looks like a good one, but it won't run on the ancient laptop that I use for PSK31, SSTV, and RTTY.

As far as CW, computers seem to have a lot of trouble decoding CW unless it is sent by another computer.

Keep trying, and you will get it working! I will help all that I can.

No, not true. Who ever told you that does not know the hybrids have a voltage doubling circuit in the HV supply!

I recommend you do some reading of the following chapters in the ARRL handbooks.

1. Electrical Laws and Circuits

and

2. Power Supplies

Read Electrical Laws and Circuits chapter first before going on to the Power Supplies chapter. If you have questions on topics or statements made in the chapters, come back here and ask.

>

Measure the HV on the Rectifier Unit's "800" terminal 'NOT' the "AC800" terminal. The voltage at the "800" terminal is the voltage doubled DC voltage which will be the same voltage displayed on the 820's HV metering setting with the 820 in transmit.

The typical impedance of a sound card's "Line-in" connection is 47K.

The typical impedance of a sound card's "microphone" connection is "600 ohms".

The typical impedance of a sound card's "CD input" is 50K.

A typical radio's speaker impedance is 8 ohms

A typical radio rear DIN audio connection may be different, possibly 600 ohms. Consult your radio's operator's or service manual for details.

A typical radio's microphone impedance is 600 to 5K ohms (modern day radios) or 50K and higher (most vintage ham gear such as Drake TR4, Heathkit SB-101, and Kenwood TS-520). The rear apron DIN audio connections may be difference so consult the operators and/or service manuals for your radio.

Don't "guess" at the impedance. Find out what it is and make every effort to "match" the two otherwise you will not achieve maximum efficiency and the cleanest signal possible on the air. It's not always about no ALC meter indication.

Hi Chris, and thank you.

Your Post has enlightened me a lot, and makes good sense. I will go into the Soundcard 'Properties' and disable all currently unused inputs. Please see my other response, as to progress so far, and I think that with the actions I describe there, plus your suggestion, I may be getting towards solutions.

Once again, Thanks very much,

John G3OBU

.
.
.
Again, may I thank everyone responding to my query, for their time and expertise. I am taking it all 'on board', but not actually doing anything, until a 'proper' 3,5mm to 6.5mm shielded patch lead arrives that I have ordered. The present one I have made up, is a bit of a 'bodged' job!

Knowing that the interconnection between Transceiver and computer is correct, I can then move forward. As well as matching impedances and disabling other sections of the sound card, I came across a very useful (To Everyone!) Article on the net on just this topic, and it mentions 'Earthing', and 'RF loops'. Very enlightening - to me at least!

I have posted the article in the files section, as a .wps (word) document for members to read, both now and in the future - Its called 'Hum and Noise Solutions' - I have acknowledged the author at the end of it.

Thanks to all you great members who spend time and effort answering stupid queries from less knowledgeable Ops like myself. This Group has a wealth of talent, ready to be tapped at any time. What a pity that all the answers to these queries are not filed away in an easy to find reference system, possibly as FAQs or similar - they must have provided a wealth of written information over the past years.

Once again, many thanks, I will report back, when I have explored the avenues suggested so far.

Kind thoughts to all and 73's de G3OBU

John

Thanks Chuck,

Thank you for your speedy response, and helpful post.

I have downloaded the whole suite of programs, not had time to look at others in there, but have concentrated on the WinWarbler. There are just so many parameters in the 'Set Up' panes, and a lot I just don't know what to enter, but I will read the documentation to see first.

I still have the same problem with WinWarbler as I am having with MULTIPSK - so, I am going back to trouble shoot. Firstly, I needed a connection line with a 3.5mm Jack on one end (computer soundcard), and a 6.5mm Jack (for the Transceiver Phones Socket). I made one up from the stereo plug off a pair of ear buds (can't get inside to solder properly, so just joined wire to wire. So - Firstly, I have just ordered a 3.3mm to 3.5mm 2 Metre Audio patch, and a 3.5mm to 6.5mm 'converter Jack' - Can't find anything 'Mono', so using Stereo. I assume that is OK? - I will report back, when they have arrived from Ebay, and I have tried a 'proper' connection. Even when I pull out the plug from the transceiver at the moment, there are almost the same signals on the 'waterfall' !!

Once again, Thanks !!

John - G3OBU

Hi John,

When you get on the air use this site
http://psk.gladstonefamily.net/pskmap.html Send a few CQ's. It's good to
see how you're getting a signal out even without any QSO's.

MultiPSK is not a bad program, but it has a VERY DISTRACTING GUI !

I was wondering if you have such a thing as a "squelch" level in the software you are using? If audio is below that level, nothing will show on the screen, no matter what is cascading down the waterfall.

Digipan is probably the easiest software to use, and if you cannot get things to print with that, you have something seriously wrong in your setup !

As suggested, turn off all echo, surround sound, equalizers, etc. and see if that makes a difference.

Good luck! Jim AG3Y

Hi Chris, and thank you.

Your Post has enlightened me a lot, and makes good sense. I will go into the Soundcard 'Properties' and disable all currently unused inputs. Please see my other response, as to progress so far, and I think that with the actions I describe there, plus your suggestion, I may be getting towards solutions.

Once again, Thanks very much,

John G3OBU

23963. TS-530S QRP

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-15 16:11:40 UTC
From: kj4aur
Topic: 23963 Message: 23963

Hello, rumor is that Santa is going to leave an amplifier under the tree this year. I've got a wonderful TS-530S with an SM-220/BS-8 working wonderfully. I'd like to drive the amplifier with 10W to 15W.

Should I apply 9V negative voltage, adjusted by a 220K Ohm potentiometer, against the REMOTE connection on the back? PIN 6 (ALC) of the connector gets negative voltage, chassis gets positive voltage?

Looking at the TS-530 manual the difference between the TS-520 QRP modification and the TS-530 is that while PIN 6 is still ALC on the TS-530 PIN 4 is not the chassis ground.

Thank you and 73.
-Nathan

> To check - (say) on 20 Metre Band. Switch on '25KHz' on the VFO knob. Tune the rig to where the Crystal Osc gives you a Signal (lets say at 14.000) Ask the wife or kids to keep hitting 'middle 'C' on your Piano, Organ or Keyboard, and tune the tuning dial until the same note is coming from your rig. Turn down the AF Gain - take the dog for a walk - have a cup of coffee, and 30 mins later turn up the AF gain and see what note your rig now matches with. Look up the notes frequency on Google, subtract the lowest from the highest, and VOILA! Thats how far your rig drifted in 30 mins. Easy Peasy !! (Middle 'C'is 440 Hz by the way !!).
>
> I don't know if it works or not, but I just read this thread and thought of it !! Thats the way your brain works at my age (I used to have 'Premature Senile Dementure' - I am much better now, as I just have 'Senile Dementure') !!
>
> Seasons Greetings to All, vy 73's de G3OBU,
>
> John
>
Err...Nice idea John, but as best I know, Middle C (AKA C4... the Fourth C note on an standard 88 note keyboard)is around 261.626 Hz and 440Hz (a standard tuning fork) is the A above Middle C. Just to show I was paying attention :-) There's a nifty little table at..
http://www.phy.mtu.edu/~suits/notefreqs.html

Nice idea, but it places more trust than I'd have in the stability of the marker generator. Xtals drift too, expecially from a cold start.
An urban radio myth maybe?

Have a nice holiday all.

Good idea for those rigs without digital display!
(440Hz is A, not C)
A decent audio oscillator software would also do.
I'm trying my TS820S from cold tonight.

Hi,
My MC50/TS820S had low audio 'till I built a simple pre-amp into the mic base. N2222 and draws micro amps. 9V battery lasts more than a year permanently on.

Also, if you tape-over the first half of the mic slots, it boosts the top and bottom slighty which sounds better.

Hi All,

I'm enjoying all the posts and learning something from the ones I can understand. I don't know much about radio, but I do know something about music. I wouldn't use an acoustic piano as a frequency standard, even if it was tuned yesterday. Too much wood and metal expanding and contracting. An electronic might be correct. Middle C is about 256Hz, but the A above that should be exactly 440Hz. Easiest way I can think of to do what the OP suggested is to use a little tuner like my Korg CA-30. To find a frequency, just use the calibrate button to run the A, which is defaulted to 440, up and down until it zero beats with whatever tone is coming out of the radio. Then read the value for A off the tuner. If you have an electronic A you are sure of, you could count the beats and add or subtract them to/from 440. I guess you don't have to know whether you are flat or sharp to get a difference figure and a percentage from that.

check your impedance switching (cable) on the mc50 . you may have the cable
set high instead of low, or low instead of high

if you go from the "loudspeaker" connection to the computer, check you af control. it may be too high, feed audio into the line in jack instead of mic jack. or make sure "mic boost" is unchecked.

it should NOT matter what software you are using, even mmtty or mmsstv or hamscope as simple as they are should give the same result....

rrtty could be on the wrong sideband. retune to the other sideband OR click on reverse on multipsk window

The Kenwood MC-50 is a dual impedance (600 or 50K ohms) microphone. It is quite possible connector "A" was inserted incorrectly at the base of the microphone which led to an impedance mismatch between the MC-50 and the TS-820. If this happens, the audio will be low resulting in low RF output.

The microphone's impedance is determined by the position of connector "A" on the rear of the microphone (RED "H" or BLACK "L").

For further details on the MC-50 dual impedance microphone, download the simple one page manual at the following link:

http://www.kg6haf.com/downloads/MC50_Manual.pdf

23975. Help Me - Possible SM-220 (BS-5 Pan Adapter) Problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-16 00:24:42 UTC
From: unnorml
Topic: 23975 Message: 23975

I have recently acquired a SM-220 Station Monitor with the BS-5 Pan Adapter connected to my TS-520S. I've done both of the mods for IF #1 & #2.
I'm confused as to the operation of the Pan Adapter.
When using the Marker as per the manual, I have a spike displayed that is always there and I have to adjust VR202 (Scan Width Adjustment) or tune the transceiver in order to move it.
The Marker button on the SM-220 doesn't seem to do anything.
I had assumed that tuning the transceiver would move the noise as appeared on the display but the spike moves instead.
I feel that I have to adjust VR202 every time I tune to a different frequency in order to see up and down the band from where I initially set the scope.
Am I witnessing normal operation or is there a problem?
Can someone please help to me?

73,

Mike - KI4FDH

marker button works the out jack just above it, and the tone selector. that connector must be wired to your mike inputs with ptt on to show results..

Thank You Very much for attention you all paid to my problem-

The screeching is on every band (last night I checked all the bands)- this is mostly between

7.180 to 7.230 (if I am on 7.000Mhz Band)
14.180 to 14.230 Mhz (If I am on 14 mtr band)
21.180 to 21.230 Mhz (If I am on 21.000 Mhz Band)
..... similarly on other bands too

beyond xx.230 or below xx.180 the reception is normal
(xx denotes the base frequency like xx is 14 for 20 mtr band and 07 fo 40 Mtr band)

All this I checked with 25 Mhz Calibrator- so I concluded that I am having problem between xx.180 mark to xx.230 mark for each band- definitely it has nothing to do with antenna or transmission of of the people- it is within my radio.

This is my first radio- I know little about SSB transmission (which helped me in clearing my Exam- nothing much in details)

Does that mean my gang capacitor is having dust accumulated in this region which opens/ operates duringxx.180 to xx.230 ???

I hope I am now cleraly describing my problem.

Please help

Kevin,

The 520 and 820 series have a 50K high impedance microphone inputs.
The 530 and 830 series have a 500 to 50K impedance microphone inputs.

Therefore, if you plan on using the MC-50 with all of the hybrids, I would recommend setting the MC-50 up for high impedance. That requires connector "A" to be installed on the rear of the microphone so the RED "H" lines up with the dot on the rear of the microphone.

23980. Re: Screeching Reception

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-16 10:43:07 UTC
From: w5rkl
Topic: 23954 Message: 23980

If removing the antenna coax cable from the rear of the radio causes the screeching noise to disappear then the problem is NOT in your radio.

When performing the following, do NOT key the radio into transmit!

While listening to the screeching noise, unscrew the coax cable from the radio. Pull the shell away from the connector, then pull slightly so the only coax cable connection is the center pin on the PL-259 to the center pin on the rear antenna connector. Does the screech noise change? If not then there's a problem with your coax cable, coax cable connection to the antenna, or both.

23981. Heads-up - Kenwood R-820 Receiver

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-16 14:51:16 UTC
From: sceneryguru
Topic: 23981 Message: 23981

Good Morning Group:

I came across a very rare animal yesterday, as I was sifting through the listings on Ebay. There is a Kenwood R-820 Receiver up for sale. If I had the funds I would certainly snap it up... unfortunately, considering the time of year, I just do not.

I mention the listing here because it's pretty close to the top of my wish list. I'm sure that I'm not alone. Particularly if you are the proud owner of a TS820/S transceiver. If you're not already aware... you can set-up the R-820 to slave with your TS-820. Man that would sure be sweet. Well enough said

I run my TS820S QRP simply by following the normal Tuning procedure and then dropping the CAR level until I am at the desired 5W or whatever power level I choose to run.

23983. Follow on from cooking the finals on an 830

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-16 16:29:41 UTC
From: sv0xbq
Topic: 23983 Message: 23983

Hi Folks,

A while ago I accidentally knocked the send switch and didn't notice until I could smell the smoke. I'm up and running again but I've got one or two questions.

I've rewound L2 with 200T 36 SWG. Replaced the cathode resistors with 5 x 22 ohm 1/2 watt giving a measured resistance of 5.2 ohms. Replaced R14 on the rectifier board. I've not neutralised the finals as max power corresponds with the plate dip.

I was always down a bit on power but I've discovered I've got 6146A's fitted. I was getting around 95 watts at 235 mA Ip. Now I'm getting 95 Watts at an Ip of 195 mA Ip. Any thoughts on this please?

L1 in the finals cage, 6.8 micro henry, looks cooked but it works. I'd like to replace it but I'm going to have to send for it. Does anyone know the current it handles? I don't really fancy putting a meter in there to find out.

Finally I've got some spare S2001A valves. Are they the same as any of the 6146's?

23985. TS-820S Diode Replacement

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-16 17:22:27 UTC
From: brad
Topic: 23985 Message: 23985

Hello All,

My first post to this great group. I have, I think, resolved a problem with my TS-820S. The radio quit receiving, transmitting and the digital display went blank on me last week when I plugged in an external VFO-820 that I had purchased on Ebay. Long story short is that I found 2 broken wires in the external VFO cable.

Just now I found what I think is now causing the problem with the radio. I found 2 cracked open diodes, D8 and D9, on the (X43-1090-02) rectifier unit. This affects the 14 volt line in the radio. I need to order replacements. The service manual lists D8 and D9 as a VOC3 diode. I am having trouble finding a replacement. Can anyone recommenend where I can purchase the VO3C or an equivalent?

Any help would be greatly appreciated,

Brad

Brad,
NTE-116 or equivalent is perfect for the VO3C diodes
1N4002 will also work and is very common.

Actually, I don't think one can ever pay "more than something is worth" on e-bay.... an auction with a huge bidding audience like that pretty much defines an item's "worth"....I can't imagine a better way to determine "worth". And with such a large audience, I doubt Tom's comments would change the outcome much.

Michael,

That will work fine for CW but not for sideband. The CAR control has no affect on the RF output in sideband.

My schematic shows those diodes (D8,9,10 & 11) as V06B's which cross to a NTE116 and the 1N4001 thru 1N4005 diodes also cross to a NTE116 so you have lots of options to look in your parts bins for to replace them.

Topic: 23950 Message: 23992

...Once again, may I thank everyone for their input to my problems - which are now resolved !!
This morning, a 'proper' shielded Patch lead to go between the 520 and my computer was delivered., and while waiting, I made up a copper earthing bar for tjhe back of my operating desk from an old copper hot water tank! - I earthed computer, ATU and Transceiver on to it, and then plugged in the new cable.
Success !!! - Everything working as it should! All I need to do, is get out in the cold weather, and make up a decent antenna . At present, its just some copper coil wire attached to the top of a 7 Mtr fishing pole!
Program. .... I installed every Digital Program I could find, and compared them, side by side. The most sensitive, I found to be the MULTIPSK - Others were much easier to use, as setting up and using MULTIPSK for the first time - especially when you know nothing much about 'digimode' communication is not for the feinthearted !!
I have done a small article, with some pics of the 'Old Way' in the 'Old Days' 50 years ago, of RTTY, when we used Creed 7B Teleprinters, as well as some screenshots of their successor - my Computer Screen - running MULTIPSK this afternoon.
Have a look at the bottom of the page, at .....
http://www.john4music.tv/27.html <http://www.john4music.tv/27.html> <http://www.john4music.tv/27.html> Once again - thanks to all who offered help and advice.

Oh just what happened to my 820... the previous owner made the same thing .
In my case it was also shorted the diode in the external vfo (the only one you can see on the board with relay. So before replacing the rectifier diodes check also that diode.
I put an internal fuse to protect the 14v line i suggest you to do the same.

!N4002 ,03, 04, 05, 06 ,07 will all work. Parts Express has 1N4007 for

$.09 each. 10 or more $.07 each.

I think that the price of ebay are the real value of object you cannot say you have payed twice the value.
At least you pay just 1 $ more than the price of the market suggest.

Actually, I don't think one can ever pay "more than something is worth" on

e-bay.... an auction with a huge bidding audience like that pretty much

defines an item's "worth"....I can't imagine a better way to determine

"worth". And with such a large audience, I doubt Tom's comments would

change the outcome much.

Thanks for telling the world about the receiver. I was hoping to bid on it

and win it without paying twice what it is worth, but I can forget that now.

Good Morning Group:

I came across a very rare animal yesterday, as I

was sifting through the listings on Ebay. There is

a Kenwood R-820 Receiver up for sale. If I had the

funds I would certainly snap it up...

unfortunately, considering the time of year, I

just do not.

I mention the listing here because it's pretty

close to the top of my wish list. I'm sure that

I'm not alone. Particularly if you are the proud

owner of a TS820/S transceiver. If you're not

already aware... you can set-up the R-820 to slave

with your TS-820. Man that would sure be sweet.

Yikes. I did not realize that they had increased in price to that level.
With both cw filters it is a great cw receiver. Problem is finding mating connectors to access the mute circuit.

Good point. I really haven't had a chance to troubleshoot the VFO-820 yet. When I plugged it in the other night and the radio failed, I have been trying to fix the radio since then. I'll do some vfo-820 troubleshooting tonight since I am waiting on the diodes for the rectifier board.

I am now pretty sure I killed D8 and D9 on the rectifier a couple of nights ago while trying to do some measurements on the ac input. I got a little spark and then notice D8 and D9 this morning.

The initial problem is the 9 volt supply at the AF-AVR circuit board(X49-1080-00). Before I killed the diodes on the rectifier board, the problem with the radio seemed to center around the 9 volts on that board. I was reading 6.16v on the collector of Q7 and it should be 9v. I have no 9v adjustment via VR4. I suspect the I have a bad transistor Q4, Q5, Q6 or Q7.

All I do know for sure is that after I plugged in the VFO-820 the other night it was all down hill. The radio won't receive, transmit and the digital display is blank.

As I see there is no extra filter.....

Paid mine 152 euros in Germany - roughly $230 - plus shipping, with 250 Hz
CW filter.

Good luck !!!

24000. Re: TS-820S Diode Replacement

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-16 23:34:47 UTC
From: w5rkl
Topic: 23985 Message: 24000

The diode you are talking about in the VFO-820 is a relay collapsing field protection diode. It can be a simple 1N4001 diode. You don't have to buy a special diode. It nothing more than a simple silicon diode connected across the relay coil. Just be sure you install the diode the correct way, the banded end at the right relay coil terminal.

I suspect Q7 on your 820's AF AVR board is toast. You can find NOS 2SA496Ys at the following website.

http://www.electronicsurplus.com/ccp78762-to-220-pnp-transistor-2sa496-y-13844.htm

If you replace Q7 I also recommend replacing D5, 6 volt zener as well.

A short on the 9VDC buss can easily take out Q7. Remember, the receiver's bias voltage, 3.3VDC and the 9VDC are all created from the 14VDC supply and are controlled on the AF AVR board. When adjusting these voltage, adjust the 9VDC first followed then by the 3.3VDC.

A blown Q7 regulator on the AF AVR board it's no wonder the 820 has problem in both transmit and receive. Most of the solid state circuitry is powered by the 9VDC supply and the receiver's bias voltage also comes from the 3.3VDC.

From: Chuck Goelz
Topic: 23950 Message: 24001

John,

sorry I've taken so long to respond.

The last part of this post mentions that you see almost the same things on the waterfall regardless of the connections to the radio... I'm wondering if you have your cable connected to the MIC input instead of the Line Input of the soundcard. If you are driving the MIC input, you will probably overdrive it if you don't provide some attenuation in the line. Winwarbler will warn of an overdriven input with a "Soundcard Overload" message (or something to that effect) in the "Receive Channel" panel, left side, just above the waterfall.. You can adjust the soundcard levels using the sliders in the Winwarbler Config window, under the soundcard tab, Mixer Adjustments (at the bottom), but if you're driving the Mic input you might not have enough range and resolution on the slider without the external attenuation. You should only be seeing a dark background on the waterfall with no signal input.

Another point is that when using a direct audio connection (one without isolation transformers), you should make sure that both the radio and the computer chassis are grounded to a common ground point. I would not rely on power cords to provide the grounds!

Cheers, and GL,
Chuck WA3CEJ

Subject: [TS-520_820_530_830] Re: RTTY & CW Reception

Thanks Chuck,

Thank you for your speedy response, and helpful post.

I have downloaded the whole suite of programs, not had time to look at others in there, but have concentrated on the WinWarbler. There are just so many parameters in the 'Set Up' panes, and a lot I just don't know what to enter, but I will read the documentation to see first.

I still have the same problem with WinWarbler as I am having with MULTIPSK - so, I am going back to trouble shoot. Firstly, I needed a connection line with a 3.5mm Jack on one end (computer soundcard), and a 6.5mm Jack (for the Transceiver Phones Socket). I made one up from the stereo plug off a pair of ear buds (can't get inside to solder properly, so just joined wire to wire. So - Firstly, I have just ordered a 3.3mm to 3.5mm 2 Metre Audio patch, and a 3.5mm to 6.5mm 'converter Jack' - Can't find anything 'Mono', so using Stereo. I assume that is OK? - I will report back, when they have arrived from Ebay, and I have tried a 'proper' connection. Even when I pull out the plug from the transceiver at the moment, there are almost the same signals on the 'waterfall' !!

Once again, Thanks !!

Hello Mike...Thanks so much for the information on the AF AVR board. Also thanks for the tip on the Q7 source. A friend is going to bring his in-circuit transistor checker over tomorrow. Like you, he and I are both suspicious of Q7.

Would you happen to have a good source for the D5 diode (WZ-061) or an equivalent on the AF AVR board?

Thanks for your help. I really appreciate it. I am quite new to troubleshooting radios. I need all the help I can get.

Thanks again,

Brad

From: Aaron
Topic: 24003 Message: 24003

I guess it would be fine to source some info on this rig here. Anyways I have a TS-900 coming and don't know much about these Kenwoods. Looking maybe for some manuals and soem general input on them. Should be a nice addition to the station and park it next to the 830.

Hi Kevin. The TS-520 requires a high impedance mic. The TS-530S and TS-830S can use either high or low impedance according to the manuals. On the TS-530S and TS-830S, use whichever setting of the MC-50 works/sounds best.

As far as the MC-50 having low output, try the other impedance. Also, I did have a problem with mine when I first got it. It had low output no matter which setting I tried. Then I disconnected the mic base, and connected the mic to the cord to the radio, and output was normal. I had a bad cord between the mic and the base.

The MC-50 should give plenty of audio unless there is a problem. No amplification should be needed.

Lucky guy Aaron. I've just taken a look at the TS-900 here
http://www.eham.net/reviews/detail/773

<http://www.eham.net/reviews/detail/773>It looks to be a really nice set.
I'd always thought that the TS-830 was the last hybrid made.

Topic: 23985 Message: 24006

Hello Brad,

Mouser Electronics, www.mouser.com sells a 6.2 volt 1/2 watt axial lead zener diode under part number:

512-1N5234B
Price: 6 cents
16K currently in stock

A possible replacement for Q4, Q5, and Q6 is an NTE-85. Mouser part number:

526-NTE85
Price $1.29
55 currently in stock

The NTE-85 has the same TO-92 package and same basic electrical specification plus the same lead orientation "E C B"as the original 2SC372.

Another possible replacement for Q4 thru Q6 is the 2N3904. The 2N3904 has the same TO-92 package, same basic electrical specifications, but the lead orientation is slightly different, "E B C" verses "E C B".

For convenience in mounting I would choose the NTE-85 simply because of it's lead orientation, they are the same as the original 2SC372. No fiddling with the leads when installing.

Aaron,

The TS-900 manual is available from Kenwood at the following link:

http://inform3.kenwoodusa.com/Manuals%5CTS-900.pdf

The manual is 34.5MB in size so it will take a few minutes to download. It require the Adobe reader to view it. Therefore, if you do not have the Adobe reader, you can get the latest Adobe reader, free, at the following link:

http://get.adobe.com/reader/

I recommend reviewing the manual thoroughly so you have a good working knowledge of how the transceiver works, what each control is used for and how to use them, plus any specific warnings Kenwood provides. The ole "Trial and Error" method of learning what each control does is not a good idea. In other words, don't "guess" what a control does, read about it in the manual so you know what it is used for and how to use it properly. All too often hams can get caught up in the excitement of a owning new or different radio and forget about reading the manual.

Chris,
The TS-900 is older than the 830, it may be a touch older than the X20 series too. I don't much about the history on these things why I threw it out there. Might make for a good discussion.

Actually, I don't think one can ever pay "more than something is worth" on e-bay.... an auction with a huge bidding audience like that pretty much defines an item's "worth"....I can't imagine a better way to determine "worth". And with such a large audience, I doubt Tom's comments would change the outcome much.

Good Morning Group:

I came across a very rare animal yesterday, as I
was sifting through the listings on Ebay. There is
a Kenwood R-820 Receiver up for sale. If I had the
funds I would certainly snap it up...
unfortunately, considering the time of year, I
just do not.

I mention the listing here because it's pretty
close to the top of my wish list. I'm sure that
I'm not alone. Particularly if you are the proud
owner of a TS820/S transceiver. If you're not
already aware... you can set-up the R-820 to slave

with your TS-820. Man that would sure be sweet.

You're welcome Aaron.

The maximum PEP input power is 300 watts in sideband with a PEP output of 150 watts. Having said that, don't be fooled into believing that pushing the 900 for those few extra "useless" watts output will make a difference at the receiving end. Believe me, 20 or 30 watts less PEP output will not be noticed at the receiving end!

Keep the the cooling fan clean and lubricated, clean the dust out of the final cage on a regular basis, clean off dust accumulation on the tubes as dust acts like a blanket and prevents cooling of the tube by the cooling fan. The same goes for components such as RF chokes, resistors, capacitors, and other components. In other words, keep the radio clean and don't abuse the 900 and it will serve you well for years to come.

If you do not feel comfortable working on the 900 because of your technical ability, by all means, find a local ham who can help you.

Just some thoughts you may not have considered.

I forgot to mention the TS-900 appears to come in 4 different models, TS-900, TS-900S, TS-900X, and TS-900D. The individual model determines the power input and output based on the type and number of tubes in the final amplifier.

You 900 may have sweep tubes in the final which, when treated properly and not abused, will last a long time.

GOT ONE,

Manual is on dk.mods I think. No schematics to be found yet for the power supply. Speaker in psply is "crap". I use a 940S speaker with it, much better.

This is a super heavy duty, almost "mil-spec", high-end (~$1100 in 1972) transceiver. I like the 70's "stereo" front panel, just like the Kenwood twins.

All circuits are on glass epoxy. plug in boards that swing down out of the card rack for servicing.

The rear panel pots for bias, etc have screw on caps to prevent unintentional movement of settings.

6LQ6's do about 150-180W PEP depending on freq.

RF gain control is actually an attenuator. The AGC is very sophisticated. The RF gain control has steps. When you step down from maximum it acts lik an attenuator and the S-meter still works, it doesn't just drift up to maximum.

I have done some receiver tweaks to mine by just replacing the dual gate depletion mosfets (circa 1970) with currently available NTE's (454, 222). Makes a big difference in noise floor and sensitivity on 15/10M.

Have fun, you got a real gem.

Greg

The TS-900s was manufactured for a short time in the early 70's (high-end counterpart to the 520 series).

There were several versions, one with 6LQ6's (TS-900S) one with 6146's and one sold in Europe with a 4CX250 (500W PEP) version.

FYI,

Greg

Before I killed the diodes on the rectifier board, the problem with the radio seemed to center around the 9 volts on that board. I was reading 6.16v on the collector of Q7 and it should be 9v. I have no 9v adjustment via VR4. I suspect the I have a bad transistor Q4, Q5, Q6 or Q7.

Hello group,

I was having trouble with the VFO in my 820S for the last month or so. The display would jump around and portions of the bands would be garbled. When tapping on the VFO the problem would go away or come back. Last weekend I removed the VFO, took off the cover, cleaned and lubricated the shaft etc. I reinstalled the VFO, checked my connections and fired up the old girl. Not good..... I have no receive on any band and the display barely lights up on the left side not showing anything legible. I checked the connections again and all my settings including the jumper on the remote VFO socket with no luck. I will be removing the VFO again tonight but wanted to ask if anyone has seen this before or had some suggestions. Thanks in advance and 73.

JR

There's a couple of possibilities that may be causing this problem

1. Intermittent/broken wire/component lead connection inside the VFO.

2, Bad/broken connection in the VFO coax cable on the rear of the VFO.

3. Bad or intermittent connection at one of the following board plugs

3A. FIX CH AVR FIX-1
3B. PLL UNIT PLL-1

4. Dirty/corrodioni connections inside the PLL and CAR UNIT

5. If TX and RX work but display is flacky, the connections inside the COUNTER UNIT may be corroded/dirty. The COUNTER UNIT has 2 board, just like the PLL and CAR UNITs do and they are connected together inside the COUNTER UNIT assembly just like the PLL and CAR unit boards are. Clean it the same way you clean the PLL and CAR unit. See below for details.

I would check the VFO cable to ensure it is good. The VFO cable may "appear" good from a visual stand point but the center pin may not be connected to the coax cable's center conductor. The VFO signal is applied to the following points:

1. Pin 1 on the rear 9 pin VFO socket

2. FIX CH AVR UNIT plug, pins 9, 11, and 13

3. PLL UNIT plug PLL-1 pin 2

Check ALL of these connection to ensure the are making good solid connection. If they are then proceed to the following check.

Turn the 820 upside down, front panel facing you.

The AF AVR UNIT is directly below the VFO and closest to the front panel.

Connect your DC volt meter to pin 1 or pin 2 of the AF AVR UNIT plug AF1. The voltage should be 9VDC. If it's not adjust VR4 in the center of the AF AVR UNIT so the voltage is 9VDC.

Move the DC meter's positive lead to AF AVR UNIT plug AF-2 pin 6. The voltage should be 3.3VDC. If it's not, adjust VR1, located between plugs AF1 and AF2 so the voltage is 3.3VDC.

If the problem still exist then remove you should check ALL of the plastic plugs on ALL boards, apply a shot of cleaner then insert each plug a number of times onto the boards. Use canned air to remove any and all excess contact cleaner and check for proper operation.

If the 820 still fails to operate, remove and clean the PLL unit and the CAR unit assemblies. Each assembly has 2 PC board inside that are connected together through a set

of fixed pins. Remove each PC board and clean the pins and the PC board sockets the pins fit into. Reinstall both PLL and CAR unit assemblies, secure them with the mounting screws, install the plugs, and check for proper operation.

verify that you did not inadvertantly put a connector back on upside down.
not even sure if it can be done, but check it

Sounds like the VFO variable cap wiper.
Remove the top cover, remove the small cover from the VFO can and apply a small amount of DEOXIT to the wiper at the rear of the variable cap.
Run the dial un and down a few times.

There are only 2 cables that plug into the rear of the VFO.

One is the VFO signal coax cable with a male RCA plug on the end and the other is the power and RIT cables.

The power and RIT cables are on one 2 prong plug. The pins on the power and RIT plug are different sizes making impossible to plug it into the VFO incorrectly.

However, rough handing of the cables can cause a break in the cables which can lead to this type of problem. The only way to verify continuity in the cable is to perform continuity checks of each cable from one end to the other. The 820 schematic shows the VFO wire path for both cables. Since the work was done mostly with the VFO, I recommend checking both cables.

Aaron.
The TS-900 is a fine radio i owned one back in the 80's. never had a problem with it. Wish i still had one.
Be sure to let us all know what model it is when you get it.
If it's the gold fronted one you are doubly lucky. very very rare.

Hi Andrea. This is not entirely true. Each person must determine how much an item is worth to them. I have seen used items on eBay go for more than the new price of that item (the item still being available from dealers). Its called auction fever. I have also seen item with the minimum bid, or buy-it-now prices set higher than dealers prices for identical items. Then there are the folks that charge inflated shipping charges to squeeze bit more profit on an item.

The best way that I have found to deal with eBay is to determine what I am willing (or can afford!) to pay for an item of interest. I then will not bid more than that amount. If I don't win the item, well an identical or similar item will eventually be up for sale again. I also ask for the shipping charges before bidding.

Savy buyers can find good buys on eBay, but the unwary may end up paying more than they should have to at times.

It's a silver face TS-900 no X, D or S. I think this group has turned me slightly obsessive unknowingly hi hi. Does anyone know what the model of the 6 Meter version was? I have seen 1 in my whole life, so I might have to track one down just to finish off the set now.

Hello Mike,

My friend brought his transistor tester over today. The collector to base leakage was 4ma on Q7 of the AF-AVR board. Not good.

I also check the D5 diode. It didn't measure up either. I get the D5 diode replacement for the AF AVR board tomorrow, but won't get the replacement Q7 until next Tuesday.

Thanks again for your help.

24028. Re: TS-820S Diode Replacement

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-18 11:33:23 UTC
From: w5rkl
Topic: 23985 Message: 24028

Brad,

It does sound like Q7 is bad. I replaced D5 and Q7 on my 820's AF AVR board simply because the drift was too much. I may also replace Q4 thru Q6 with NTE-85 transistors but, for now, replacing D5 and Q7 was sufficient.

Once you remove Q7 from the AF AVR board, remove the screw that hold Q7 to the heat sink. Apply some silicon grease to the new Q7 then secure the transistor to the heat sink using the same screw and nut. The most time it took me was getting the original Q7 off of the board. Kenwood bent the leads flat against the board then soldered them. Found the same bent leads with the two 2200ufd 25VDC filter capacitors in the 14VDC supply.

24029. Ebay prices

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-18 17:28:27 UTC
From: rkersey tds.net
Topic: 24029 Message: 24029

Hi All,

I agree that ebay prices are sometimes bid up too high. I recently bought a radio item for $110 from a ham privately who responded to an inquiry of mine. Two of the same went on ebay for $76 some weeks before, but then one was bid up to $156 the week I bought. Off ebay the going rate for the item appeared to be about $100. Some sellers do not want to fool with ebay and they may just set a price, which might be higher or lower than market value. You can look for the deals if you are patient and will walk from a deal that isn't good. I guess you all know this . . . .

You can sometimes get an idea of what the ebay price should be. If you are registered with ebay, go to the left margin and check "Completed Items" and the recent history of sales of that item will come up. Prices in green indicate completed sales and prices in red indicate items that did not sell because opening bid or reserve was not met or there were no bids. My apologies for taking bandwidth to state what many of you know already, but possibly some don't.

I have been making deals in pawn shops for years and I know that I am not going to be able to negotiate a good price when I feel I just must have something. The guy can smell it, I think. On the other hand, when I really don't care and turn to walk away, amazing things sometimes happen, like the oxy-acetylene torch and tanks that I bought for $75 before the Chinese were making them . . . .

Ran across a VFO-900 at LandAirCom by dxzone.com.

No prices but listed in used equipment

yesterday, decided to move all the rigs from operating position and dust/clean under them---moved the 520s back and flipped on the power switch and left the room.(second mistake)
after 10 minutes, i came back in and noticed i had bumped the send switch into the "send " position while moving.(first mistake)...the rig had been in the send position on lsb all this time.

Now i can only get about 120 ma of plate current and have stopped at this point for fear of hurting something else......your troubleshooting tips will be greatly appreciated as i love this old rig!

Thanks in advance,

I purchased my TS820s complete with MC60A microphone from Ebay and think I got a pretty good deal. I paid £135(about $200)although I must admit that I have seen others go for far more.

I think the trick for getting a good deal on Ebay is to look for auctions that end during the day mid-week. The best way to get a good price for the stuff you are selling is to have your auction end on a Sunday night. That way the bidders have all weekend to browse and place their bids.

In LSB mode, all the finals would be drawing (Ip) would be the 60 milliAmp idle current and the RF output would have been just about Zero watts. Can't see what harm that would have done !

i agree, as long as there was no audio driving the finals, the 120 sound high, but was it that way before you moved it. follow the manual. the worst that should happen is there is no output to the antenna. you may be surprised

good luck

Hello Group,

Wow thank you for the detailed troubleshooting from all. As quoted below I was able to check continuity of the power/RIT cable and the coax cable which plug into the VFO. I was able to check voltages on the AF board. I recorded 3.345 volts and 8.99 volts. I also removed the CAR board and PLL board, checked, cleaned and reinstalled with no luck. The unit still only has very minimal static when in receive and will not load or tune when adjusting the drive control. The unit does switch into TX mode when the send/receive switch is activated. Is there any tests to the VFO itself I can perform? I suspect an issue with this due to the fact that it is the only piece I have removed and cleaned. I see no issues in the rest of the radio that are obvious. I noticed a circuit board mounted to the VFO. Could a resistor or capacitor on this board be causing an issue? I thoght I would go through and check as many as possible. I am also going to verify power to the VFO. The strange issue is the lack of illumination on the readout. Only the first two digits show any illumination at all and that is very minor. No sign of a formed number just a faint illumination of the two. Thanks again.

73

Hi Kelly,

Join the club. I did this a month or so ago. If you've damaged the finals you'll be able to smell it without taking the covers off. If you can't smell any burning it might be good to double check that you're operating the set correctly before going further. If you want to take a look, after the power has been off for a while and it's unplugged from the wall socket, remove the top and bottom covers and the cover on the finals cage where the tubes are. The plate choke sits between and just to the inside of the set from the tubes. It should look like new. Before touching anything I always like to ground various components in this area before touching. You'll also need to check the 4x 20ohm cathode resistors that live next to the tube sockets. You'll easily see if they are damaged.

Chris

From: w5rkl
Topic: 24017 Message: 24043

Jey,

First, the 820's VFO operates on a set range of frequencies between 5.000Mhz and 5.500Mhz regardless of the MODE and BAND SWITCH settings!

The VFO is powered from the 9VDC source. The 9VDC flows from the AF AVR UNIT board, plug AF1 pin 1 and 2, through the FUNCTION switch wafer S5-3, through the rear 9 pin VFO socket pin 8 to pin 9, and then to the internal VFO through the larger of the 2 pins on the VFO power plug.

If there is a break in the path, such as the jumper plug is removed, the VFO will have no DC power resulting in the VFO not working. If the VFO doesn't work then neither transmit or receive will work. In addition, the digital display will not display any frequency regardless of the MODE, BAND, VFO dial, and DH switch positions/settings! So, it's important that the VFO be working.

Another area that can affect the power to the VFO is the FUNCTION switch wafer S5-3. If the FUNCTION switch is set to the wrong position, there will be no DC voltage to power the VFO. For simplicity sake, make sure the FUNCTION switch is set to "VFO" (12 o'clock). Forget about the other settings for now, you can learn about them later.

You can check the VFO frequency by connecting a frequency counter to the rear of the VFO at the female RCA socket. As indicated above, the VFO should produce a frequency from 5.000Mhz (top of the band) to 5.500Mhz (bottom of the band). Again, it doesn't matter what position the BAND and MODE switches are set to, the VFO frequency range never changes, it's always from 5.000Mhz to 5.500Mhz, regardless of the MODE and BAND switch settings!

If you do not have a frequency counter, connect a wire to an all band receiver's antenna. Wrap the other end with tape to ensure the wire doesn't touch anything in the 820 and lay the wire across the VFO metal enclosure. Tune the 820's VFO so the analog dial displays "0.0". Tune the separate receiver to 5.500Mhz. If the VFO is working you should hear the VFO signal quite strong. You may have to tune the separate receiver above or below 5.500Mhz. If you do NOT hear the VFO signal then the 820 VFO is most likely not working.

You said you removed the 820's VFO and cleaned it thoroughly. If the above test using a separate receiver, shows no VFO signal then you may have broken a component or wire lead inside the VFO. This, also, is assuming there is 9VDC being applied to the rear VFO power pin (larger of the 2 pins on the VFO power plug).

Make sure the RIT push button is turned OFF, not pressed, and the IF shift is centered, FUNCTION switch is set to "VFO" (12 o'clock).

The rear "SG" switch has nothing to do with this problem nor does the heater switch. The SG switch only controls the polarity of the voltage applied to the final tube screens and the Heater switch controls the driver and final tube filament voltage.

The COUNTER UNIT has 2 board, just like the PLL and CAR UNITs do and they are connected together inside the COUNTER UNIT assembly just like the PLL and CAR unit boards are. Clean it the same way you clean the PLL and CAR unit. See below for details.

You won't hear the Marker signal if the receiver's now working.

Since both transmit and receive are affected, the problem is associated with one of the 3 common circuits, PLL, VFO, and CAR UNITs and quite possibly power to all 3. I discussed this in a previous response. So, start doing some voltage checks.

I was able to check voltages on the AF board. I recorded 3.345 volts and 8.99 volts. I also removed the CAR board and PLL board, checked, cleaned and reinstalled with no luck. The unit still only has very minimal static when in receive and will not load or tune when adjusting the drive control. The unit does switch into TX mode when the send/receive switch is activated. Is there any tests to the VFO itself I can perform? I suspect an issue with this due to the fact that it is the only piece I have removed and cleaned. I see no issues in the rest of the radio that are obvious. I noticed a circuit board mounted to the VFO. Could a resistor or capacitor on this board be causing an issue? I thoght I would go through and check as many as possible. I am also going to verify power to the VFO. The strange issue is the lack of illumination on the readout. Only the first two digits show any illumination at all and that is very minor. No sign of a formed number just a faint illumination of the two. Thanks again.

24048. Help TS-520 recap

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-20 06:24:42 UTC
From: n7zef
Topic: 24048 Message: 24048

Howdy
I would like to re-cap my TS-520, mainly because of the age of the radio. I have the recap kit I got from eBay, and noticed there was very little in directions, that is, what caps on what boards to change.
I am asking for suggestions or advice on what others have done to recap their radios. I noticed a lot of "bread ties" on the wire bundles. Are these reused, or can nylon ties be used. Does wires have to be removed and reconnected to make enough room to work, or is there another method. Do all boards need to be done?
I am not afraid to work on this, just looking for others ideas on this. This radio looks like it was taken care of, just the back is a little dented. It has both filters, and the original tubes.
Appreciate any help not only for me but possibly someone else planning the same.
Thanks
73
Mike - N7ZEF

Thank you W5RKL and all the others who responded. Last night while checking voltage to the VFO from the AF board I was able to get the unit functioning again. I am not 100% sure but I believe I found a bad solder joint where the 9volts supply comes into the VFO and then jumpers up to the circuit board. I must have disturbed it enough to cause the break. The only issue I have now is the VFO will only tune down to 7.015 and so on throughout the different bands, 14.015 etc. One question I have regarding a frequency counter, I own an MFJ 269B antenna analyzer with a built in frequency counter. I have heard that the counter in this unit is not accurate enough for an alignment tool. Any thought on this? If not what would you recommend for a frequency counter so I may carryout parts of the 820S alignment procedure? I am studying the service manual at this point to see if I may have bumped something else or if I am having a mechanical issue now. Thanks again to all.

Hi all
Just thought I would say hi. I am a retired 68 year old that now has time to go back to my hobby of about 58 years. I was given a copy of the "Handbook", I think it was about a 1948 issue when I was 10 years old and have been hooked on electronics every since. Back about 35 years ago I did get my novice ticket, was WBØZPK, but ended up letting it expire because of time constraints of work, 16 or more hours a day in my own restaurants. Now being forced into retirement by a massive heart attack I am back studying to take both my tech and general tests. I have 2 TS-830S "gold", a TS-820S, a TS-940S/AT sitting on my desk waiting to be hooked to wires when I do test. I do have an ICOM IC-745 that I have a random wire hooked to so that I can listen.

I guess I have rambled long enough but just wanted to say hi to everyone.

BERNIE MI

Jay,

I suspect the reason for the VFO only tuning down to 015 on all band is the dial itself is out of alignment. This happens quite often when the VFO has been removed.

I'll describe the steps as simple as possible. Read and fully understand the steps before you attempt any of them. The important thing, as I will say a few times, is the dials must not scrap and there should be no stiffness is tuning the VFO regardless of where on the dial the knob is rotated! The VFO should and can, if proper steps are taken, tune as smooth as oil on glass! My 820 dial tunes as smooth as oil on glass with absolutely zero stiffness or scrapping! So, take your time, it can be done!

Make absolutely sure you do NOT loose any screws!! I use an old egg carton to hold the screws.

1. Set the 820 on the desk, front panel facing you.

2. Turn power OFF.

3. Tune the VFO to the point where the VFO stops are felt. Do NOT force the VFO beyond this point!

4. Remove the VFO know

5. Remove the 2 screws hold the flat calibration knob.

6. Remove the bearing ring.

7. Remove the 4 screws holding the dial escutcheon to the front panel.

8. Loosen the set screws on the front dial and remove, slide the dial off the shaft.

9. Turn the 820 on, set the FUNCTION switch to 25Khz.

10. Loosen the set screw hold the rear dial.

11. Rotate the VFO shaft clockwise and zero beat the Marker signal. The digital dial should indicate x.000.00.

12. Rotate the rear dial so the number "5" is at the 1 o'clock position. There is only one number 5 on the dial and tighten the set screw. Make any corrections to the VFO shaft so the digital dial continues to display x.000.0. If necessary, loosen the rear dial set screw and rotate it so the number "5" is at the 1 o'clock position then tighten the set screw. The key is to have the number 5 at the 1 o'clock position AND the digital display showing "x.000.0".

13. Slide the front dial onto the VFO, maintaining x.000.0 on the digital display. The front dial's "00" should line up at 12 o'clock and the number "5' should appear centered in the square window to the right! This is important! If it remove the front dial, loosen the

rear dial's set screw, rotate either direction, then tighten the dial, again, maintain x.000.0 on the digital display. Slide the front dial onto the shaft, "00" aligned at 12 o'clock, and number 5 centered in the square window to the right. Tighten the front panel's set screw. The digital display should show x.000.0, 00 on the front dial aligned at 12 o'clock, and number "5" centered in the square window to the right.

14. Once this is done, install the dial escutcheon, bearing ring, calibration dial, and main VFO knob, in that order. Rotate the VFO knob, listening for and feeling for any scrapping and/or stiffness. Fix any scrapping and/or stiffness!

The dial should tune from one end of the dial to the other without any scrapping and/or stiffness. Also, watch as the dial rotates past each 100Khz. From x.000.0 to x.999.0, the small window should be blank. At each 100Khz, 100, 200, 300, 400, and 500, the windows should advance by 1 numbers. I.E., tuning to x.100.0, the small window should show a "1", at 200, a "2", 300 a "3" etc.

Look at the analog, digital, and 100Khz dial, when the VFO is tuned to the bottom of the dial, x.000.0. All 3 should be at "0"! It's ok if they are not exactly at zero but try your best to get them at "0". The 100Khz dial is the one at the top of the analog dial. It has 0, 100, 200, 300, 400, and 500 with 50Khz marks between each 100Khz marker. If the coil and capacitors have not been messed with the dial should track rather close throughout the rotation of the VFO.

This may take you a few tries to get it right but, like I said, the VFO should tune as smooth as oil on glass with absolutely no drag or stiffness! If it doesn't then you have not aligned the dials correctly.

This procedure is outlined in the 820 service manual BUT the translation from Japanese to English is, in my opinion, not very good. I had to read the manual a number of time to understand what Kenwood was saying.

Unless there are major changes inside the VFO, do NOT adjust the coils. Align the dials FIRST! More than 95% of the VFO problems of this nature are dial alignment and NOT coil adjustment issues. So, again, align the dial FIRST!

Okay, enough of my babbling on. If you have any questions, ask!

Hello Mike,

No, you do not have to replace all of the capacitors in your 520.

The important capacitors are the HV capacitors (directly behind the VFO), the bias supply capacitors (2 x 33ufd 160VDC on the Rectifier Unit), and 2 x 2200ufd 16VDC capacitors on the bottom right corner (520 turned upside down).

If you replace the 2 x 2200ufd 16VDC capacitors, replace them with capacitors that have a higher voltage rating, 25VDC instead of 16VDC. Maintain the same capacitance, 2200ufd and same axial lead capacitors. Kenwood increased the voltage rating of these capacitors in the 820, 530, and 830 series hybrids.

There are 2 black dual capacitor cans located under the VOX and Marker UNIT boards. Each can has two 22ufd 450VDC capacitors inside each can. These require some work to get them replaced. There are no original direct replacements for these caps. These are the filter capacitors for the 300 and both 210 Rectifier Unit supply voltages. To find them you must remove the VOX UNIT and Marker boards, 520 right side up front panel facing you, on the top left rear. The wiring is on the bottom.

You can replace other capacitors as time goes on but for now, that's about all you should replace.

If you are not sure how to do this may I recommend finding a local ham who has the experience in this type of repair so he can help you.

I strongly recommend replacing the filter caps on the bias supply. Lose bias, lose your finals. Mike is absolutely on the money with his recommendation.

Hello Group;
I bought an MC50 mic from a fellow and the hi-lo transformer has been removed for whatever reason. He failed to tell me this and I don't recall asking(should have). All he said was that it worked.
So, if anyone has a spare transformer from a parted out mc50. I know that Heil makes a d104 kit/etc. But that matching xfmer is std 1k/50ohm audio, I installed the one I have, doesn't work so well. Imp presented to radio is too low. TS820s is looking for hi imp.
I swapped eqt for mc50, so the 820 has a mic, but I would like to fix this onr for the 520s.

Hi. The MC-50 mic element is probably about 600 Ohms impedance. So
you would need to find an audio transformer 600 Ohms to 50K ohms.
Even if you can't find the exact impedance values, something close
should work. If you do some looking on the net, you will probably be
able to find something.

Personally, I would be looking for for your eqt back, as the guy
didn't tell you about removing the transformer. I consider that he
didn't tell to be the same as a lie. He DID lie by omission of a fact
that you should have been told!

My thoughts ...
If a hybrid (or all tube) radio has not been used in years (in storage?) the HV B+ filters would be the ones to change and maybe some of the low voltage A+ filters.
My TS520 has been in constant use since the day I brought it home from the store new. The longest it has sat idle has been a week or two when I was away on vacations or schools. .
There is no reason for me to replace anything because this radio was designed to be used and not stored away !
Still works fine.

Howdy
I would like to re-cap my TS-520, mainly because of the age of the radio. I have the recap kit I got from eBay, and noticed there was very little in directions, that is, what caps on what boards to change.
I am asking for suggestions or advice on what others have done to recap their radios. I noticed a lot of "bread ties" on the wire bundles. Are these reused, or can nylon ties be used. Does wires have to be removed and reconnected to make enough room to work, or is there another method. Do all boards need to be done?
I am not afraid to work on this, just looking for others ideas on this. This radio looks like it was taken care of, just the back is a little dented. It has both filters, and the original tubes.
Appreciate any help not only for me but possibly someone else planning the same.
Thanks

Mouser sells a small 50K CT primary to 1K CT secondary audio transformer for $2.08 a piece. You can look at the data sheet for this transformer at the following link:

http://www.mouser.com/catalog/specsheets/XC-600134.pdf

Mouser's part number is:
42TM117-RC
Price: $2.07 each

Check to ensure the size of the transformer will fit in the MC-50's base. Since I don't have an MC-50 I can't tell for sure. The data sheet measurements are in "inches".

Hi Guys,
There is no transformer in the base of the MC-50. All that's in there is the PTT switch. On the MC-50 you change the impedance by unscrewing the cable from the rear of the mic body and rotating it 180 degreees. If you look close there is a little red dot and "H" and "L" letters. In the "H" position I think it's 50K.

Chris

Look at the mic data sheet.
MC50 mic has a low impedance dynamic element and contains a transformer
that's switched by the mic plug setting.

That is true. The impedance matching transformer is located inside the microphone body, not in the base. This is quite evident by reviewing the MC-50 instruction/operating document.

>
> Hi Guys,
> There is no transformer in the base of the MC-50. All that's in there is the PTT switch. On the MC-50 you change the impedance by unscrewing the cable from the rear of the mic body and rotating it 180 degreees. If you look close there is a little red dot and "H" and "L" letters. In the "H" position I think it's 50K.

24071. Sad for my TS-820... need spare

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-21 14:49:07 UTC
From: Andrea Liverani
Topic: 24071 Message: 24071

At least i have found the problem of my ts-820.
The bandswitch inside the PA tank has burned and irreparable contacts
on 20meters band.
I need a working bandswitch in order to repair my radio.

The first question is if the bandswitch is the same of the other hybrids
(i don't' think so because 530 and 830 have warc bands also), but maybe
is the same on ts-520.

the second question is where can i buy one ? has anybody a spare to sell?

Topic: 24048 Message: 24072

Hi Mike,

On my TS-520S I replaced just the power supply caps that Mike, W5RKL, suggested, plus a small cap (C11) on the Fix Channel AVR Board. I did the latter because I had jumpy (erratic) AGC action. With just the above caps replaced my rig is performing flawlessly. If you contact p_simpson@rogers.com, he may e-mail you some step-by-step instructions on replacing the HV caps. Caution-lethal voltage so be sure the radio is unplugged and discharge the HV caps with a screwdriver.

>
> No, you do not have to replace all of the capacitors in your 520.
>
> The important capacitors are the HV capacitors (directly behind the VFO), the bias supply capacitors (2 x 33ufd 160VDC on the Rectifier Unit), and 2 x 2200ufd 16VDC capacitors on the bottom right corner (520 turned upside down).
>
> If you replace the 2 x 2200ufd 16VDC capacitors, replace them with capacitors that have a higher voltage rating, 25VDC instead of 16VDC. Maintain the same capacitance, 2200ufd and same axial lead capacitors. Kenwood increased the voltage rating of these capacitors in the 820, 530, and 830 series hybrids.
>
> There are 2 black dual capacitor cans located under the VOX and Marker UNIT boards. Each can has two 22ufd 450VDC capacitors inside each can. These require some work to get them replaced. There are no original direct replacements for these caps. These are the filter capacitors for the 300 and both 210 Rectifier Unit supply voltages. To find them you must remove the VOX UNIT and Marker boards, 520 right side up front panel facing you, on the top left rear. The wiring is on the bottom.
>
> You can replace other capacitors as time goes on but for now, that's about all you should replace.

You are absolutely correct. It is easy to forget that the cable to the microphone will plug in one of two positions. For the 830, red and H must line up and you should be good to go. I clean the PTT contacts with DeOxit 5 and a gentle scrubbing with a fiber nail board. They carbon over with time.

Hi All,

Several years ago, about 2004, I bought a working TS-830S from a ham in Texas. I don't have the emails we exchanged at that time any more, so I don't know what he changed or worked on in the radio, if anything. I had planned to get my General ticket then, but just got around to doing it a few weeks ago. I'm hoping to get the station set up after Christmas. With the discussion about changing the various caps I just read, I'm wondering if I need to do anything besides just plug in the radio and see if it works. It's been boxed up for the last five years . . . .

Andrea Which wafers do you need. I need a RF bandswitch for a 520S and perhaps we can find one that will solve our problems. I doubt if a TS-520 BS will work for you as it does not have 160m whereas the 820 does.

Gent's
I've asked this before but I'll ask again;

Has anyone fitted a SM220 with BS5 band scope to a 520s? And if you did, did you follow the instructions in the SM220 manual? These appear to be wrong because how can you view 100/20 kHz after the SSB Xtal filter. The band scope in my experiance with other Txcvr's must be before the SSB Filter. However in doing this with the by-pass cap spec'd in the SM220 manual this mod loads the IF stage down. Any experiances would be appreciated.

Cheers, Frank VK5KV

Hi Joe,

There's a UK ebay seller called Hifissb. He's always got a lot of Kenwood
parts listed. It might be worth sending him an email to see what he's got.
I've used him before, he's ok.

Seasons Greetings,
Chris

If you can, use a variac to bring up the voltage slowly.

If you don't have a variac start with a filament lamp in series with the main ac supply,

it will reduce the likelyhood and extent of damage.

Hi All,

Several years ago, about 2004, I bought a working TS-830S from a ham in Texas. I don't have the emails we exchanged at that time any more, so I don't know what he changed or worked on in the radio, if anything. I had planned to get my General ticket then, but just got around to doing it a few weeks ago. I'm hoping to get the station set up after Christmas. With the discussion about changing the various caps I just read, I'm wondering if I need to do anything besides just plug in the radio and see if it works. It's been boxed up for the last five years . . . .

Try reseating any plug connectors in line with the mic jack. Had a TS-140 one time the mic audio quit. Reseating one of the cable connectors in audio path cured it.

Also look at the mic plug. Tighten each individual female socket by bending the metal in a little with a sharp screwdriver so the contact is tighter when it's plugged in. (hope that make sense). The contacts get loose over time.

24092. Bringing voltage up on TS-830S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-22 15:34:29 UTC
From: rkersey tds.net
Topic: 24092 Message: 24092

Hi All,

My apologies for failing to have an appropriate subject line on that last post . . . . where would I find a variac? Just borrow one from somebody? And start about 10 volts and then just crank up in five or ten steps?

If I were to use a "filament lamp" instead, would that just mean setting up a 100 watt bulb in series with the 830 or ???? Sorry to be so ignorant, but I guess this is how you learn . . . .

YOu can purchase one at "All Electronics" at the following link:

http://www.allelectronics.com/make-a-store/category/805/Variacs/1.html

This where I bought mine, 10amp, variable AC transformer. It works great.

A lamp wired in series with the transformer's primary windings is to determine whether or not the transformer is shorted. Use this only when you are unsure if the power transformer is shorted.

One more thing. When using a variable AC transformer to power up a radio that has sat for a long time, years, and the radio has tubes, remove the tubes before applying power. Once you are sure the radio powered up fine without the tubes, turn the radio OFF and insert the tubes and apply power.

Any tube that shows a white coating anywhere on the inside of the glass envelope must be replaced. The white coating is Barium and Barium turns white when exposed to air. A white coating indicates the glass envelope is broken or crack and the tube needs to be replaced. Some tubes, such as the 6146 beam power pentode tube, may not show the white coating on the inside. Look along the base of the glass envelope and if you see white coating on the inside of the glass envelope, replace the tube. Don't even try to test the tube because the vacuum inside the tube is gone!

24094. TS-440 problem, might be applicable to the Hybrids.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-22 17:02:05 UTC
From: Ken
Topic: 24094 Message: 24094

Hi Guys...

I was working on my TS-440 this past weekend and found something that may be of interest to the Hybrid group.

When I finished doing the alignment I put the rig back together, hooked up all the outboard gadgets and started operating PSK-31... I didn't see any audio on the waterfall. The speaker and headphones worked OK, just no audio to the back Accessory connecter.

I started tracing the audio signal from the IF board. With the back-panel audio cable connected to the board no audio was seen but the signal was on the board with the cable dis-connected. This meant that the rig had developed a short somewhere between the IF board and the back panel connector. Couldn't see any damage to the visible parts of the cable so I removed the ATTuner to get to the back Accessory connector.

There I noticed 3 of the pins of the back-panel sub-board connector had moved back out of the connector shell and 2 of these pins (the audio line) were shorting together. After pulling the small plastic connector shell, reinserting the pins and connecting it all back together, the audio was fine all the way to the PSK interface.

While in there, I looked around and found several more pins that looked OK but were not fully seated into the connector shells; i.e. I could tug slightly on the wires at the back of the connectors and the wires (and pins) would simply come out of the connector. Reinserting them fully with needle nose pliers (until they clicked) solved the problem.

I don't know whether the wire inserting individual was having a bad day when my rig's connectors were being manufactured or not but I didn't see any indication that the connectors were at fault, just that the wires were not fully inserted into the connectors during assembly.

You might want to give your rig's connectors a good "going over" the next time you are having intermittent symptoms.

Ken - KB7H

24095. Re: kenwood 830

Yahoo group: TS-520_820_530_830 (2009)

From: w5rkl
Topic: 24061 Message: 24095

I recommend cleaning the MIC gain control using contact cleaner then rotating the MIC gain control back and forth a few times. Follow this procedure with canned air to remove any excess contact cleaner. Test the radio for proper operation in sideband.

If that doesn't fix the problem, I recommend tracing the audio signal from the microphone, starting at pin 1 on the MIC socket through the circuit path to the collector of Q21. At anytime, through the path, you loose the audio signal, back up to the last point where you had the signal and you will have found the source of the failure, the next stage after the stage you have signal. You can use an oscilloscope to do this simple test.

I recommend you using the high resolution TS-830 schematic when performing this diagnosis. Take your time and you should find the source of the problem rather quickly using this method.

One last thing. As one response stated, reseat the plugs, in this case, plug 7 on the IF UNIT.

Just some troubleshooting tips you may not have thought of.

24096. Dumb tuning question for a 520s

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-22 05:50:17 UTC
From: doug_t@rocketmail.com
Topic: 24096 Message: 24096

Hello, new guy here. Just got my general ticket and a 520s.

When adjusting the Drive with the mode switch at ALC and stand-by switch in send, instructions say to adjust for maximum meter deflection. My question is do I adjust for maximum deflection on the ALC scale, or the entire meter travel? (Well not to peg it of course)

Thanks in advance.

24097. Lost my VOX - TS-520SE

Topic: 24097 Message: 24097

Hi All: I had been suffering from delayed T/R switching and it was suggested that I clean the contacts. When I started I discovered that one of the previous owners had soldered the board connectors which made the task difficult. I cleaned the contacts and reinserted the relay. when I fired up the rig the slow relay was fixed, but the VOX doesn't work. totally dead. I inspected visually but couldn't see any broken wires. Ant suggestions to trouble shoot would be appreciated.

I'm starting to feel a bit of roughness in the VFO tuning control. I've cleaned and lubricated the gears and bearing in the front and that's about as far as I've gone.

Does anyone have this problem? If so, how did you correct it? Will I have to remove the entire VFO unit to make a repair.

Thanks everyone. And my sincere wishes for a happy and joyous holiday season.

Thank you for the link Rick, I have already downloaded the manual and also have the tuning instructions from KG6HAF. Like I say, it's a dumb question, but not addressed directly in either instruction set.

Do I peak the Drive for maximum deflection *on the ALC* scale or the other scales on the meter?

24102. RE: [TS-520_820_530_830] Re: Dumb tuning question for a 520s

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-22 19:15:15 UTC
From: Dick Merryman
Topic: 24096 Message: 24102

During tuning, peak the drive for maximum deflection on the entire meter. Ignore the ALC scale. If you cannot get good deflection then increase the CAR control and re-peak. The ALC scale has no meaning when the transceiver is in TUN mode.

Thank you for the link Rick, I have already downloaded the manual and also have the tuning instructions from KG6HAF. Like I say, it's a dumb question, but not addressed directly in either instruction set.

Do I peak the Drive for maximum deflection *on the ALC* scale or the other scales on the meter?

Hello Pete,

I assume you have the VOX switch turned ON.

Insert a mono 1/4" plug connected to a CW key or keyer into the rear panel CW socket. Make sure the CW key or keyer is not pressed or keyed.

Tune the 520 up for maximum RF output into a dummy load.

Set the MODE switch to CW.

Set the CAR control between 9 and 10 o'clock.

Set VOX to "ON".

Press the CW key or press one of the keyer paddles.

What happens when you do this? Does the 520 produce the CW sidetone and place the 520 in transmit?

> Hi All: I had been suffering from delayed T/R switching and it was suggested that I clean the contacts. When I started I discovered that one of the previous owners had soldered the board connectors which made the task difficult. I cleaned the contacts and reinserted the relay. when I fired up the rig the slow relay was fixed, but the VOX doesn't work. totally dead. I inspected visually but couldn't see any broken wires. Ant suggestions to trouble shoot would be appreciated.

Hi Doug,

I'm thinking it is the ALC meter.

I use K4EAA's instructions he has posted at
http://www.k4eaa.com/tune-up.htm.

Hope that helps some.

Adjust for max deflection using the drive control and use the car control to leave the needle at the top end of the meter scale when the drive is peaked, not on the peg but right over to the end of the scale. Just use the ALC part of the meter scale when you transmit so you don't overmodulate the carrier. Then set the drive control at zero before dipping the plate current. Most importantly, don't leave the send switch flipped for more then 5 seconds or so at a time.

If you took it up on a variac I'm not sure you'd get any indication that an
electrolytic was going to fail until it went bang. I'd still want to clean
it out before anything else, including the spiders.

Hi Guys. I don't think that this is correct. While the TS-520 manual doesn't say, the manual to my TS-530S does indicate that when adjusting the drive control for peak, the reading should be kept within the ALC scale. It says that if the meter pegs or goes outside of the ALC scale, to turn down the CAR control.

I am sure that Mike (W5RKL) could give a more definitive answer.

Hi Chris,

One part of your instructions is a little confusing to me. I followed them just to make sure but they don't give the correct result. You can't turn the DRIVE to zero and expect plate current or RF.

Here's what I do.

First step - switch to TUNE and set meter to ALC. Adjust the DRIVE control for max indication. If the needle goes full scale then back off the CAR control until the needle is somewhere above 2/3 of full scale. The actual value is not important we just want to see the peak.

Leave the DRIVE control alone now. If you turn it to zero you get no RF and no plate current.

Switch the METER to Ip and use you PLATE control to dip the plate current.

Now switch to CW and use your PLATE control to dip the plate current again. Use your LOAD control to get the plate current to the desired level. I like to run my radio at 225mA.

The LOAD and PLATE controls interact so you might need to go back over the adjustments a second time.

The ALC meter scale is not used in TUNE mode.

The ALC meter is used as a tuning aide ONLY in TUNE mode.

The ALC meter indication is the peaking of the final tube grid drive (grid current flowing in the final tube grids). The ALC meter setting is much more accurate than the IP meter setting.

Disregard the ALC meter scale during TUNE mode adjustments, it's not used! The ALC scale is only use in USB or LSB mode.

Thanks to all. I guess it wasn't quite as dumb of a question as I thought. I've been using W5RKL Mike's (and Dick's) advice today. Nothing smoked, I made my first three contacts and even got a compliment or two on my signal.

Appreciate the great list.

The diodes you are speaking of, D1 thru D8 on the Generator Unit board, are 1N60 40VDC Germanium diodes and they are available from Newark Electronics for 33 cents each. Newark Electronics part number is 39C4519.

http://www.newark.com/jsp/search/productdetail.jsp?SKU=39C4519&CMP=AFC-TL10000001

Diodes D1 thru D4 on the Generator Unit board are the transmitter's balance modulator diodes. D5 thru D8, also on the Generator Unit board, are the receiver's balance detector diodes.

What symptoms are you experiencing that points to the replacement of all 8 of these diodes?

Sorry for the confusion. My fault. The second reference to drive in my post
should have read "load". ie after peaking the alc with the drive control,
dip the plate current with the load control set to zero. Otherwise I find
that the dip can be too shallow to see easily. Then I work up the load and
dip each time to get max output.

Chris

Hi Andrea.

Now you've asked a touchy question.

While I've never had one,
the most popular hybrid amateur transceiver seems to me to be
the Kenwood TS-520S.

There are several reasons for this.

It is a simple radio to work on and to work with.

It is very forgiving.

It sounds good to the ears of any listeners
on either side of a radio conversation.

It has a robust chassis.

It looks good, and has no distracting extra functions.

It is an honest radio which has stood the test of time.

It works well with a plethora of antenna and aerial types.

Parts to keep it going are relatively easy to get.

It's stood the test of time!

(That's not to say it will be the best radio for you!)

.....

However, my own choice in the Kenwood series turned out to be
the Kenwood TS-820.

The reasons for my choice were as follows:-

It was readily available.

It was a major challenge to fix because:-
it was poorly treated by its previous owners
it had the digital electronics in it's DG-1 frequency counter
it had potential for further improvement to it's audio in receive and
transmit
it had integrated circuits
it had transistors
it had compromised diodes in its detector
it had compromised valves (although I found this out later)

it had old dried out capacitors (which I half suspected)
it had single layer parts component boards
it had corroded connectors and dry solder joints
it had burned out lamp bulbs
it had missing rubber feet
it had dangerous power supply design (although I found this out later)
it had rust and corrosion visible
it had dents and scratches visible
it had a loosened house power plug
it had screws missing
it had compromised earthing for its electronics circuitry (by design)
but then I was looking for a good challenge when I bought it.

It was a solid project which I anticipated would become a "work of art"
for me that I could play with when I had to keep myself awake at nights
while I was looking after my severely disabled wife, and listening to
her breathing through assisted breathing equipment without my having to
be in the room with her while she slept.

The TS-820 was all the TS520 ever could be for me but it presented me
with a greater set of challenges.

I am not sorry I bought it, even though I still haven't got it running
up to my expectations yet.

.....

The other choice which I made was for a Yaesu FT102.
This is a hybrid amateur radio transceiver which is much superior to all
Kenwood hybrid transceivers in almost every way.

It has some failings though.

Its failings are it uses unsealed relays and is too complicated to work
on and with, when you compare it to the Kenwood hybrids, Also its gauges
are too small for me to see properly without my glasses, as and when I
need to read from them.

.....\
...

So for all the reasons mentioned, and if usage and time is the best
gauge to test with, and if you keep to the rule of comparing unmodified
rigs, I don't think you can confidently say any hybrid rig is overall
better than any other, but after modification and usage, there are
individual radios which are remarkably better performers or have stood
the test of time because of their simplicity and solidarity in build.
After all it is "horses for courses" and "a king is only king of his own
kingdom!"

It's up to the assessor to assess before he can judge.

Each assessor has to assess within his own parameters.

I hope this helps.

If you can't find anyone willing to part with an 820 factory CW filter, INRAD sells number of filters for the TS-820. See the following link for details:

http://www.qth.com/inrad/

By the way, the only difference between the TS-820 and the TS-820S is the "DG-1" COUNTER UNIT assembly. Therefore, a factory or INRAD crystal filter designed to be used in a TS-820 will also work in a TS-820S. The INRAD filter may be slightly larger than the factory filter. See INRAD for details.

One last thing that many hams may not be aware of. A crystal filter from any 520 series radio will not work in an 820 series radio and vice verse. The reason is the different IF frequencies between the 520 and 820 series radios. The 520 has a 3.395Mhz IF frequency while the 820 has an 8.830Mhz IF frequency.

Also if you can find a "-1" filter, these are the same filters (example YK-88SN-1) but soldered to the PCB for a solder-less connection. De-solder the filter and it'll work fine since the IF is 8830KHz. I used a YK-88SN-1 in my TS-530S.

The "-1" seem to be easier to find, for example, here is a YK88CN-1
https://www.hamcity.com/store/pc/viewPrd.asp?idcategory=344&idproduct=1275

I think you may have luck finding a YK88C-1 looks like here's one,
http://www.hamstation.com/shopping/index.php?main_page=product_info&products_id=289

Note I have no affiliation with hamstation/hamcity nor have I ever used them.

24131. External DSP units

Yahoo group: TS-520_820_530_830 (2009)

From: Peter
Topic: 24131 Message: 24131

Hi All:
I'm enjoying my TS-520SE and even with a 20M wire dipole only 15 feet off the ground I've managed to make contacts to Holland and England with good reports. But, I do have an issue with noise and other interference.
I'm interested in any comments regarding external DSP units. No CW, just SSB. I've looked at some of the reviews on eHam, but want to reduce the number of units to cosider.

Thanks in advance.

Pete, N1TCH

Yes Kurt, I agree. Having owned 3 520s, 1 520S, 1 520SE, 3 820s, the TX-310/JR-310, the TS-510/VFO-5D, 1 R-599/T-599 and 1 R-599D/T-599D; my all time favorite "King of Hybrids" is the last (R-599D/T-599D). It is by far the highest quality, best performing, most flexible and unusual Kenwood I have ever owned. Features like the "Squelch" and built-in switchable filters blow away the IF-Shift on the 53X/8XX series transceivers. Other items I like about this set is the absence of a digital readout, responsive S-Meter/Sensitivity setting, preciseness and feeling of the knobs, the frequency dial accuracy, and the fact that it has the "AM" mode; which I use infrequently and get great audio reports. My second favorite all time Trio/Kenwood set, for CW, is the TX-310/JR-310, which is a "daily driver" for me. Tube warm-up is about 3 minutes which is a minor drawback.

73 and Happy Holidays to all, Lou N2JPR

Hi Andrea.

Now you've asked a touchy question.

While I've never had one,
the most popular hybrid amateur transceiver seems to me to be
the Kenwood TS-520S.

There are several reasons for this.
my ....

Adjusting the DRIVE control in TUNE mode for a peak meter indication is NOT about adjusting the DRIVE control so the meter needle rest at the high end of the ALC scale nor does it mean to adjust the DRIVE control and CAR control together so the meter's needle rest at the right edge of the meter scales either! It is simply about adjusting the DRIVE control for a peak meter indication and absolutely nothing more!

If the meter pegs all the way to the right, simply rotate the CAR control counter clockwise for a lower meter indication, say so the meter needle points at 12 o'clock, then continue adjusting the DRIVE control. Again, if the meter pegs all the way to the right, readjust the CAR control counter clockwise for a lower meter indication and, as before, continue adjusting the DRIVE control for a peak meter indication.

If, while adjusting the DRIVE control, the meter indication begins to drop back to the left towards zero, adjust the DRIVE control in the opposite direction so the meter peaks and then STOP adjusting the DRIVE control.

Continue with the adjustment of the PLATE and LOAD controls as outlined in the manual etc.

Topic: 24131 Message: 24135

Hello, I use the West Mountain Radio CLRspkr with my TS-530S and it's wonderful. It's great at completely eliminating heterodyne, QRM, and QRN. Honestly, I use it almost 100% of the time. I often use it in the DSP "high" position or the "max" position depending on noise. There are *MANY* times where I could not hear the other station without significant fatigue without the DSP.

They also make the CLRdsp which is the CLRspkr minus the actual speaker.

Both the CLRdsp and CLRspkr use the ClearSpeech algorithm from NCT Group Inc, http://www.nct-active.com/ which is used in NASCAR, cellular phones, etc.

I'll say it's night and day difference and it's easy of use "on/off and level" make it easy. This is one purchase I've made that I don't regret. Well worth the money.

Merry Christmas Everyone,

I have a VFO-820 that I recently purchased on Ebay. The dial lamp is burned out. Does anyone know of a replacement for this lamp. It is a 12vac, 40ma lamp. The Kenwood part # is B30-0079-05.

Any help would be greatly appreciated.

Merry Christmas. When I had my TS-820S I replaced both lamps (one was burnt out, the other was replaced so it would match) by using this:

http://www.radioshack.com/product/index.jsp?productId=2104023

The Radio Shack matched the original color very well and was the same warm color. It was slightly (5%) brighter than the original so I went ahead and replaced them both so they would match.

Ken, K4EAA, also sells replacements, located here:

http://www.k4eaa.com/parts.htm

Hope this helped and 73.

Thanks Nathan....I didn't even think of Ken's web site. I have bought parts from him before for my TS-820S. I guess I just assumed that the lamp in my VFO-820 was different. I should have checked the TS-820S parts list.

Thanks for setting me straight.

I do have a question for you if you don't mind. I purchased this VFO-820 on Ebay and received it about one week ago. I plugged it into the TS-820S and it was all down hill after that. To make a long story short, I discovered an open transistor on the AF-AVR board with the help of Mike W5RKL in this group. The radio is back up running great, but I am afraid to plug the VFO-820 in again. The problem on the TS-820S after plugging in the VFO-820 was the 9 volts supply on the radio. It was only measuring about 6.1v.

My question is....I did not have the chassis ground strap connected between the radio and the external VFO. Maybe I had a floating ground on the VFO without having that good chassis ground reference? Do you or anyone think that caused the issue with the radio? I also found 2 broken wire in the VFO-820 cable on pins 3 and 4. Pin 4 provides 12vac for the lamp. Pin 3 is ground.

Just wondering. I have checked everthing on this VFO I can think of and can't find anything wrong except a burned out pilot lamp.

Thanks again,

Brad

I may have to let others chime in on this once since they're likely more experienced than I. I'm still learning as I go (perhaps why I enjoy the hobby so much) and offering what little bit of knowledge I've picked up along the way to others. I was never able to source a VFO-820 cable due to the scarcity of the socket connectors. What I ended up doing was taking some quality wire and tinning both ends. I plugged these directly into the socket, maintaining a straight-through connection (from what I remember). I later bundled the wire with wire wrap and threw a ferrite choke on it.

As I recall I did ground the VFO to the TS-820S but I believe I also operated it some time without the ground whilst I was experimenting with the VFO cable.

Perhaps a broken ground wire in the VFO cable is indeed the culprit. 73 and hope to catch you on the bands.

Hi Brad. I would check the VFO cable with a VOM to make sure that you have no more broken wires or shorts in the cable. If it was me, I would re-wire the cable with new wire, possibly from a sheilded Cat 5 computer network cable.

The reason that I would do this is that if 2 wires are broken inside the cable, other could break and/or short out too. The insulation on the wires in some multi-wire cables can get brittle and crack over time. It is best to use shielded cables, and make sure all all equipment is grounded together via the connecting cables or external ground connections.

Maybe someone with a working VFO could give you readings on each pin of the cable with it connected to the VFO (but not the radio).

TTYL, good luck, and Merry Christmas!

Thanks Martin....

I probably could have explained the 2 wires I found "broken" a little better. They had actually come unsoldered at the connector one one end. I repaired them after the radio failed. I have checked the cable end to end and for shorts and it measures out ok. I'm just a bit nervous about plugging the VFO-820 back into the radio.

Thanks again,

73

Hi Nathan,

I completely understand about the learning process. That is what makes it so much fun with these old rigs. When I got this one working again the other night I was like a kid at Christmas... ;)

Take Care and have a great holiday.

> I may have to let others chime in on this once since they're likely more experienced than I. I'm still learning as I go (perhaps why I enjoy the hobby so much) and offering what little bit of knowledge I've picked up along the way to others. I was never able to source a VFO-820 cable due to the scarcity of the socket connectors. What I ended up doing was taking some quality wire and tinning both ends. I plugged these directly into the socket, maintaining a straight-through connection (from what I remember). I later bundled the wire with wire wrap and threw a ferrite choke on it.
>
> As I recall I did ground the VFO to the TS-820S but I believe I also operated it some time without the ground whilst I was experimenting with the VFO cable.
>

> >
> > Thanks for setting me straight.
> >
> > I do have a question for you if you don't mind. I purchased this VFO-820 on Ebay and received it about one week ago. I plugged it into the TS-820S and it was all down hill after that. To make a long story short, I discovered an open transistor on the AF-AVR board with the help of Mike W5RKL in this group. The radio is back up running great, but I am afraid to plug the VFO-820 in again. The problem on the TS-820S after plugging in the VFO-820 was the 9 volts supply on the radio. It was only measuring about 6.1v.

> >
> > My question is....I did not have the chassis ground strap connected between the radio and the external VFO. Maybe I had a floating ground on the VFO without having that good chassis ground reference? Do you or anyone think that caused the issue with the radio? I also found 2 broken wire in the VFO-820 cable on pins 3 and 4. Pin 4 provides 12vac for the lamp. Pin 3 is ground.

Still have my two favorites. TS830s and a Pair of 599D's with matching speaker. would be hard pressed to make a choice between them.

Hello Wayne,

My first thought is the plugs on the COUNTER UNIT (digital display board) and other boards.

The plastic plugs that plug into each PC board have been known to cause problems in the past, not only the 830 but other hybrids as well.

I recommend removing each plug, one at a time, and give the plug and the pins a shot of contact cleaner. Insert the plug a number of times then seat the plug one last time. Make sure it sits flush on the board and none of the wires are broken. Use canned air to remove any/all excess contact cleaner.

Do this to all of the plugs in the 830.

I also recommend checking each PC board's mounting hardware. The edges are typically ground returns and if corrosion builds up between the board and the metal mounting stub/chassis, the ground will present a resistance which shouldn't be there. Loosen each mounting screw then re-tighten the screw. Do not use excessive force as you could strip the threads on the screws and/or mounting stub/chassis.

Check voltage on the COUNTER UNIT board plug 1 pin 3, it should be 12VDC.

73s
Merry Christmas
Mike W5RKL

Wow-this is a difficult question since I have never owned one of the Yaesu hybrids. However, my first "real" rig was a TS-520 that brought so much excitement to my hamming. Then I traded it in for a TS-530S that I used for many years before selling it on eBay (mistake!!). Now much later I bought a used TS-520S for a ham friend and have really enjoyed fixing it up. I have never owned a TS-830S, but many people think it is the "King of Hybrids". Of the units I haved owned, the TS-530S was really primo, but I liked all of them. Kenwood really made a great series of rigs!

Hi Folks - I hope by now, the effects of the extra large Christmas Dinner has worn off !! (Its 2.30am 26 Dec, and I am still 'Bloated!).

Off Topic a little - What about the Pilot Lights on the Meter and Dial on the TS 520SE?

Mine are working fine, but I want to do a little modiification - based around the fact that there is no Dial Light in the AT-230 Tuner, and I would like to run power for a lighted meter through the back of the unit (Small hole and rubber Grommet?). at the back - so I thought 'Hmmm! The Dial and Tuning Lights in the Transceiver are a bit dim - so why don't I change them for either Green or Blue LED's ? (and of course, the AT-230 Meter to match).

Has anyone done this? Is there anything I need to know, beyond hooking up the 13.8V feed from the INSIDE of the 520SE (I am using the external socket for the DG-5!) - to the LED's.

View my Mod in Pictures, to the AT230 to install an internal Dummy Load at ... http://www.John4Music.TV/27.html

Happy Holiday to all,

John G3OBU

John-

Don't drill a hole as it will affect the resale value of your unit. Matter of fact, adding a lamp would change the value. However, if you are determined to illuminate your VFO then why not use a LED from the 9V supply in theVvFO?

Thinking about it, I have a VFO 520 and a VFO 230 and they are both lighted. Are you sure that your's is not?

The very best of the new year to you and yours,

Hi Dick .....

Thank you for the speedy response, and your interest.

The AT 230 is an Antenna Tuning Unit not a VFO (Wish I had one !!) .....
I understand your concerns about hole drilling, but the alternative
would be still to drill a hole in the back of the Transceiver and the
AT 230 to fit sockets for an interconnecting lead.

I am sure also that fitting green or blue lighting in both units would
also de-value, but I operate in a dimly lit area, and the meters need
some stronger illumination! - That means heat, and why I thought of
LED's ... if LED's - why not coloured? was the next thought !!
This is possibly sacrilege to some members, as we are striving to keep
these tranceivers on the air as 'working museum pieces', and they should
be as 'original' as possible, !! LOL

Others thoughts appreciated.

John,

RFI on the tuner's dial lamp power source wiring is more of an issue than drilling a hole in the rear panels of the tuner and hybrid.

I have to ask, how are you going to RFI proof the tuner's dial lamp wiring?

Have you considered what could happen to your transmit signal if RF is picked up by the tuner's dial lamp wiring in the AT-230 tuner that is then fed to the LV DC supply in the radio?

If you power the dial lamps in the tuner from the LV DC source in the radio, as it appears you are considering based on your recent response comments, RF picked up by the dial lamp wiring in the AT-230 tuner can and will result in RF being imposed onto the entire LV DC supply. This will result in RFI on your speech amplifier which will lead to RF distortion on your transmit signal. Personally, I wouldn't do it. It all sounds like a good idea on the surface but there's too much of a risk for dial lamp power source wiring that can cause RFI in the radio's LV DC supply.

Just a thought you may not have considered.

I recently bought a S-830S that someone has modified to use LEDs rather than the original incandescent bulbs. I intend to make some changes, I don't think the mod was done particularly well, but they did include some small RFCs where the wiring comes out of the VFO compartment and I was planning to do that also. And this is for a case where we are not even talking about wires that come outside the case, they just run a few inches inside. So I second the idea that thinking about RF pickup and spread is a "good thing"!

I hope to keep this rig forever once I get it all spruced up, so holes in the back panel are not an issue for me. And I don't know the VFO820. But on many of their boxes Kenwood did provide unused holes, planning ahead for whatever small connectors you might want to add. Or, on that VFO-820, are their any extra pins on a back panel connector that you could use? You only need one line, for the switched power, since presumably ground is already connected.

Bob,

Replacing incandescent dial lamps in the 820 itself does not require RFI protection. Those LED may be nice but I personally don't care for a bright LED lighting up the meter and dial. I can see both just fine with inexpensive easy to install incandescent dial lamps.

The VFO-820 already has a dial lamp, same as in the TS-820 and in the same place. The VFO-820 is the same VFO that is inside the TS-820. The dial assembly and the VFO are exactly the same. You can remove the VFO and dial assembly from the VFO-820 and put it inside the TS-820 without any modifications or changes!

I visit a lot of ham forums such as qrz.com, eham.net, and qth.net and read a lot of the messages posted on these forum. I can honestly say when someone asks a question about their Kenwood hybrid, whether it is a TS-520, TS-530, TS-820, or a TS-830, in almost every case, the person asking the question is referred to this forum! That simple referral, in itself, speaks highly of this forum!

Hi John. I know its nice to have the meter lighted in a tuner. Some of the current MFJ tuners unclude a meter light, only requiring an external power source. However, I think that others here are correct that trying to power an LED from your radio may cause problems due to RF pickup in the wiring.

My MFJ 941D tuner did not include a meter light...so I added one. Actually two, one red, and the other green. I used colored 12V bulbs from Radio shack. I added a single pole double throw switch with a center off position so that I can select the color that I want. The bulbs are powered from a float charged 12V battery that I can use to run my solid state radios if mains power goes out.

In your case, I suggest using an external power supply. The current drain with an LED is small enough that you could use almost any small supply that you are using for anything else in the shack, or even a plug in transformer (we call them wall worts here) type supply.

The factory meter and dial lights in my TS-130SE have a slightly green cast, and I like that. I have thought about replacing the bulbe in my radios with LEDs, just have never gotten serious about it.

Just my thoughts...

Anyone know of a filtering mod or anything of the like. I am a member of the Coastal Carolina Emergency Net on 3.907 and live in Pennsylvania. The 3.910 crowd runs audio wide open and splatters from 3.910 to 3.902. If there is something I can do to alleviate some of this nonsense I would like to know - PLEASE. I am open to and appreciative of all inputs.

By the way - HAPPY NEW YEAR TO ALL!

Hi. If they are over-driving and splattering that much, there isn't much you can do. A narrow SSB filter may help a little, but probably not much with such a situation. The Iowa Traffic net on 3970Khz has a similar problem with a group on 3685Khz. Especially with one lid that runs full legal limit all the time, and has a dirty, overdriven signal besides.

Has the net control ever asked them to back off the mic gain? I know with most lids like you describe, it wouldn't help though. In the case of the group and the individual I described above, they know that they are interfering, and seem to be doing it on purpose. This is from comments that I and others have heard many times from them.

I really do wish that more U.S. Amateurs would pay more attention to the FCC rule that requires the use of the minimum power necessary! And that doesn't mean the minimum power necessary to have an S9+60db signal at their good buddy's location. Better yet, the FCC could drop the power limits from 1500 watts PEP to 300-400 watts PEP!

Thanks everyone,

What a great Group, and what a wealth of talent is available for us lesser mortals to 'brain pick' !!!

I think - following the advice given, that I will have to 'grin and bear' the dim lighting on my 520SE, and no meter light on the AT 230 ATU. but perhaps Martins suggestion of mounting a 9v PP6 battery inside the ATU for a LED lamp for the ATU meter would be a self-contained and viable option - perhaps with just a mini switch on the back of the ATU - I will buy a Battery and LED and do some experimenting with temporary trial positioning and whether RF does affeect the wires between the battery and LED via the switch inside the ATU is a reality.

Once again - thanks guys for your kind and practical advice.

De

24163. Digital Modes

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-27 03:15:44 UTC
From: Music Maker
Topic: 24163 Message: 24163

Hi Folks,

Just starting back in Amateur Radio after a VERY long absence. Digital to me - when I last Operated was a Creed 7b working RTTY !! Anyone remember these old 'Clatterers' ??

Now - PSK, with a computer - Geez!!! great stuff - and at 74 years old, what a challenge to my one remaining brain cell, learning about it all - with no-one to lean on. A very steep learning curve !!

At present, I have FOUR programs running in my computer - Winwarbler, MULTIPSK, Fldigi and Digipan. I am trying to evaluate the relative merits of these 'side by side' - At present, I prefer Digipan, I think.

At this moment I am only listening, connected Rig to 'Line In', but have ordered a digital interface and a serial to USB converter, and will then have transmit capability.

Only thing puzzling me - is how to get my 520 SE's output down to 20 or 30 Watts - I believe that somewhere, I read that I can externally wire a 9V battery into a couple of spigots on an external socket on the transceiver to put a negative voltage to the Grid of the driver Valve. I really have so many questions, but its all the more fun to struggle my way through all the information on the net, than take the easy way, asking loads of questions on here !!

Like many of you, I feel that 'Macros' should be consigned to the bin - with all that useless and irrevelent and boring stuff that gets sent over and over to constitute a QSO. However - on reflection - there is another side to this. Here in UK, I am listening only to I, F, D, R, O stations, who probably can't speak English. But really - how impersonal to just conduct a QSO with just a string of Macros both ways - Whats the point? - Whats the Purpose?, a total waste of bandwidth, electricity and time - in my opinion. Macros, just one or two used sensibly are fine (such as CQ calling), so I guess, when I eventually get transmitting, and actually TYPING it will really throw them, when they can't respond with a Macro back that would be a response to my over, as I would start 'ragchewing' HI HI !!!!

Finally (at the end of this epistle!), I am looking for an external VFO (the 520), if anyone has one, or can look out for me in the US. as I have never seen one come up for sale on Ebay here. I would be interested in a 'clean' one, even if 'Dead', that I could work on.

Seasonal Greetings to all,
De
John G3OBU

Did you ever try MixW? Quite a program... Sorta the Swiss Army Knife of digital programs... Yes, it cost's 50 bucks, but once you have it, upgrades are free... And, once it is setup you can almost carry on a QSO just by hitting function buttons... Just a thought...

There has been several post in the past about setting the ALC with a 9 volt battery. I've never done it before so someone else will have to step up on that. I've ran PSK on my Heathkit HW-101 in the past. Just tune up your radio normally and then turn the mic gain down. Using the audio level control in the computer and the radio mic gain, adjust the audio level into to the radio to set the TX RF level. Low audio in equals low RF out. Easy to run at low levels with soundcard audio that way.

John-

PSK runs in SSB mode and in that mode the power output is directly proportional to the audio in. By adjusting the output of your sound card using the Windows sound adjustments you can vary your xmtr power output from a few milliwatts to full power.

The 9V battery bias trick is only necessary in CW mode which are not used in the digital modes such as PSK and RTTY.

Hi John,

You don't need to modify your 520 for low power bpsk transmission. Tune for full power as normal and then use the mic control to limit Ip to just over 100 mA when you transmit. This will give you around 30 watts out. Also you don't need a usb connection. Connect the sound card mic and line in to the two phone sockets on the rear of your 520 via an interface and use vox on transmit. (I've also connected directly to an old laptop without an interface and operated for weeks with that setup with no problems. I wouldn't recommend it though). I use Digipan and I'm not familiar with any other programs. With Digipan, I use macros to start a QSO. The flashing cursor sits on the end of the macro text being transmitted so you can then continue with the keyboard. When finished I end with a macro. A bit like a morse qso. Being located in Greece, I can often only get eastern European stations at this time of the year. I use the keyboard but if I get an obvious macro response I continue with macros. A lot of stations here don't have good English or they want a quick qso and then want to move on. I little something that you may be aware of but it's worth mentioning. Text sent in lower case is sent faster than upper case so I leave the caps lock off.

John,

Chris raised a good point about lower case being faster than upper case... Unlike ASCII, PSK uses "Varicode" character representation, and frequently used characters are sent using fewer bits. All upper case characters are transmitted using more bits than their lower case equivalents (I think Samuel Morse had the same idea !!). I know I have a file saved somewhere that shows the actual codes used for each character, and will share it if I find it...

Meanwhile, I'll have to work on my macros to make them more English friendly. Mostly, they are written in American, but I do speak both. I can open the bonnet on my car to check the engine. I can put the hood down to enjoy the wind in my hair. I can put my bags in the boot, and carry bits and spares as well. Well, I have to carry spares because I drive a 1958 MGA (not in THIS weather, though!). And I look forward to my next visit to see my friends in Basildon, Essex, and in Nantymole, Wales...

I hope everyone here has had a wonderful Christmas, and will have a happy new year!

Cheers & 73,
Chuck WA3CEJ

Hi John,

You don't need to modify your 520 for low power bpsk transmission. Tune for full power as normal and then use the mic control to limit Ip to just over 100 mA when you transmit. This will give you around 30 watts out. Also you don't need a usb connection. Connect the sound card mic and line in to the two phone sockets on the rear of your 520 via an interface and use vox on transmit. (I've also connected directly to an old laptop without an interface and operated for weeks with that setup with no problems. I wouldn't recommend it though). I use Digipan and I'm not familiar with any other programs. With Digipan, I use macros to start a QSO. The flashing cursor sits on the end of the macro text being transmitted so you can then continue with the keyboard. When finished I end with a macro. A bit like a morse qso. Being located in Greece, I can often only get eastern European stations at this time of the year. I use the keyboard but if I get an obvious macro response I continue with macros. A lot of stations here don't have good English or they want a quick qso and then want to move on. I little something that you may be aware of but it's worth mentioning. Text sent in lower case is sent faster than upper case so I leave the caps lock off.

From: Adrian Ellison
Topic: 24163 Message: 24169

This is very not true Dick,

The 9V battery bias trick is only necessary for SSB, to facilitate power reduction with ALC still operational.

In CW it is usual to back the CAR control off so that the ALC is not operating anyway, as this gives cleaner keying, and you can back it off as much as you wish, and likewise for Digital modes, you don't want to see any ALC on Digital modes, so you'd back the MIC control off at least until there's no ALC reading, and further down to reduce power as required.

So, for CW and Digital modes, tune up in the normal way, with the ALC limiting maximum power, then back the CAR/MIC controls as required.

Regards

Adrian - ZS1TTZ

hi, don't you think that ft-101ZD sounds a little muffled in comparison with
kenwood hybrids?
I both have FT-101ZD (mark II) and FT-902DM and even if they are wonderful
radios in many aspects, i prefer to use the KHYB (Kenwood Hybrids) for ragchewing..
but i have to say that ft-101E has a very pleasant audio.
Actually my preferred one is ts-820S even if i am finishing it's restoration..

John,

I agree with Don Thomas' comments about the soundcard output level and mic gain. Adjust your mic gain down till the ALC indicates zero, then turn it down a just a little bit further!

I'm interested in your evaluation of the digital software that you are trying. Please let us all know how they compare, and their strengths and weaknesses!! Hope to see your callsign on the waterfall some day...

Cheers, 73,

Chuck WA3CEJ

Subject: [TS-520_820_530_830] Digital Modes

Hi Folks,

Just starting back in Amateur Radio after a VERY long absence. Digital to me - when I last Operated was a Creed 7b working RTTY !! Anyone remember these old 'Clatterers' ??

Now - PSK, with a computer - Geez!!! great stuff - and at 74 years old, what a challenge to my one remaining brain cell, learning about it all - with no-one to lean on. A very steep learning curve !!

At present, I have FOUR programs running in my computer - Winwarbler, MULTIPSK, Fldigi and Digipan. I am trying to evaluate the relative merits of these 'side by side' - At present, I prefer Digipan, I think.

At this moment I am only listening, connected Rig to 'Line In', but have ordered a digital interface and a serial to USB converter, and will then have transmit capability.

Only thing puzzling me - is how to get my 520 SE's output down to 20 or 30 Watts - I believe that somewhere, I read that I can externally wire a 9V battery into a couple of spigots on an external socket on the transceiver to put a negative voltage to the Grid of the driver Valve. I really have so many questions, but its all the more fun to struggle my way through all the information on the net, than take the easy way, asking loads of questions on here !!

Like many of you, I feel that 'Macros' should be consigned to the bin - with all that useless and irrevelent and boring stuff that gets sent over and over to constitute a QSO. However - on reflection - there is another side to this. Here in UK, I am listening only to I, F, D, R, O stations, who probably can't speak English. But really - how impersonal to just conduct a QSO with just a string of Macros both ways - Whats the point? - Whats the

Purpose?, a total waste of bandwidth, electricity and time - in my opinion. Macros, just one or two used sensibly are fine (such as CQ calling), so I guess, when I eventually get transmitting, and actually TYPING it will really throw them, when they can't respond with a Macro back that would be a response to my over, as I would start 'ragchewing' HI HI !!!!

Finally (at the end of this epistle!), I am looking for an external VFO (the 520), if anyone has one, or can look out for me in the US. as I have never seen one come up for sale on Ebay here. I would be interested in a 'clean' one, even if 'Dead', that I could work on.

I love this kind of debate! It really ought to take place after your radio club's "natter night" when all and sundry have had a couple of beers!

I really wouldn't like to offer a definitive answer, as each marqe made its own contribution to producing memorable kit.

From my own collection I would say

TS520 really set the performance standard, and absolute classic, the 820 of course was the "Rolls Royce" version of this radio. (OK I regret selling my '820 now!)

FT101 (pre 'ZD) developed in response to user feedback.

FT901/2 tried to be a "professional" (ie few cost-saving shortcuts)logical development of the '101.

FT101Z series, cost reduced version of 901/2 but (like the earlier '101) series responded to user feedback and improved and improved culminating in the '101ZD Mark III (one of my personal favourites)

Meanwhile Trio/Kenwood's 530 series and the 830 (very clever dual-conversion RX with IF width control) were a carefully considered development of the 520 series.

And you mustn't disregard the FT102 with it's "big boots" PA and IF width control which was presumably a response to the '830.

And don't forget that the WARC 79 bands coming along really forced the manufacturers' hands in having to tool up for this challenge.

It's a bit like being asked "who is your favourite child?"

Great fun and encourages one to put everything in perspective.

For me I reckon (today) that the TS830 gets my vote 55:45 versus the FT-101ZD Mk III.

Tomorrow I would probably decide the other way!

back your HF gain down as far as possible, choose a narrow filter and with the use of passband tuning, you can get rid of most of these morons. We suffer from the same kind of "amateurs" overhere, but sad to say, otherwise you can't do much at your end.

Happy newyear to all

John,

I have a AT-200 (the nonWARC version of the AT-230), that I use for all my antenna switching and tuning. Max power here around 100 Watts.
When I bought the tuner a previous owner had modified it to include a lamp above the meter. The lamp is fed by an external adapter, the same I use for an homemade external VFO for my Yaesu's.
I never had any problem with RF feedback or other troubles.
If you want to be sure just put in two 10nf condensers between the wires and ground, that will take care of any HF, but I never needed them.

If you have the tuner open, carefully check the connections: in mine I found at least 4 connections that were made but not soldered.
(Maybe a Mondaymorning product) That was maybe the reason I got it really cheap (just 25 euro's).............

Just my 2c

24175. TS830S digital readout

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-27 10:04:31 UTC
From: Victor
Topic: 24175 Message: 24175

Hi all
Having problems with the readout again. Once again it locks on the lowest readout on each band (e.g.13500.0)and will not move. Also the led VFO light stays off.
If I switch Fix on the readout goes blank and the Fix light comes on switch back to VFO and again the read out comes back on but is still locked and no VFO light.
I did notice that prior to this the VFO light used to flicker for a while before it stayed on.
Also, the DH button has no effect - doesn't do anything.
Seems to indicate that the VFO isn't working but the rig still tunes across the bands. I thought maybe the counter unit wasn't getting feed from the VFO. I have checked and cleaned all the connections but still the same.
Any ideas, please?
Hope you all had a good Christmas.
Vic - G4JSS

Aloha John,
Yes just use the Mic gain to get the output you need. As for programs Digipan is good but I have found DM780 that is bundled with Ham Radio Deluxe to be the best program I have used to date. I have tried them all including MixW ($50USD)and DM780 blows it away. Ham radio deluxe or HRD is as far as I am concerned the best Ham program out there it has a excellent loging program, a DX cluster that runs with the logging program and many other features that just make it very easy to use. It also has Rig control that will not work with the older kenwoods (I use it with my TS-850) but you would still have the logging and the DM780 to use and best of all it's FREE yes I Said FREE,
You can go here to check it out
http://www.ham-radio-deluxe.com/Downloads/tabid/54/Default.aspx
So have fun on the digital modes and I hope to see you on my waterfall.
73 and Happy New Year
Roland AH6RR

Hi John. Others have answered you question about setting the power output very well. My only addition is make sure the speech processor is off. As to using macros during PSK QSOs, I do use a few. Mainly for things that would otherwise have to be typed over and over again. Such as calling CQ, back to you, sign off and of course the infamous brag macro. Macros can be a good thing for those who are making contacts in a second language, or are poor typists (Like ME!)

My "brag" macro gives a brief description description of the equipment in use at the time. I don't go into any detail, just the rig, computer, antenna, and output power I am using. I know many people go into far too much detail about their station in their brag macro. I feel trhat such a macro is ok, if it is kept brief! If the other party wants more info about your station, they can ask.

I know that many hams are proud of their stations, but all macros should be kept as short as possible. Could I make a short contact using just the macros? Possibly. But even with my poor typing skills, I like to chat a bit.

From: w5rkl
Topic: 24175 Message: 24179

Vic and Roland,

Vic said the receiver can be tuned from one end of the band to the other. If that is true for all bands then the VFO and PLL units are both working.

The FIXED button controls 9VDC that powers the VFO, both FIXED and VFO LEDs, and the crystal oscillator (Q37 and Q38() on the PLL UNIT.

With the FIXED button NOT pressed, 9VDC is applied to the VFO plug pin 3 to power the VFO and to the VFO LED, turning the VFO LED "ON". The crystal oscillator, Q37 and Q38, do not work and the FIXED LED is turned "OFF". This is normal.

With the FIXED button pressed, 9VDC is applied to the PLL UNIT crystal oscillator, Q37 and Q38, through PLL UNIT plug 8 pin 8 and to the FIXED LED turning the FIXED LED "ON". The VFO does not work and VFO LED is turned "OFF". This is normal.

I recommend checking the COUNTER UNIT's reference oscillator. See page 35 item 8. A frequency counter is required for this measurement.

From: ki0gv
Topic: 23504 Message: 24180

To The Group,

This is kind of off target. But I have an MC-50 that I'm putting on my TS-520S, However the schematic I have for it is not totally correct. I'm having trouble figureing the wireing on the transformer themselves white, yellow, red, brown and black along with the black and blue wireing coming from the mic element itself. Can somebody just explain to me where these wires go, Because somebody has unsoldered the wires off of that little brass connection plate and the wires are just everywhere.

Thanks & 73'S
ki0gv
Mike

Hi Mike,

Take a look at Gordon's site. There's a MC-50 manual that tells you
exactly what you need to know.

24182. TS-820S restoration project

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-28 08:19:10 UTC
From: Andrea Liverani
Topic: 24182 Message: 24182

Here is the work in progress. You have to know that before
i had little experience in repairing HF radios so i am proud of the results i have
obtained:

patient: TS-820 LINE composed of TS-820S , VFO-820, SP-820.

Problem:

14V line shorted and damaged due to short circuit between external vfo to internal vfo...
(this is the cause why the previous owner sold the radio on ebay... a lot of smoke)...

Solution: new connection cable between vfo-820 and ts-820 , new diodes in the 14 volt
line circuit. New diode in the vfo-820 relay circuit and new Q9 and diode in the FIX board
of the ts-820 (the tx relay was not working).

Problem:

NO power in TUNE mode:

Solution:

1 resistor was opened in the tune circuit , replaced.

Problem:

DG1 not working, display was dark.

Solution:

Cleaned all of the connectors in DG1 circuit. Now i have a working display except for the
100hz
digit that is still not working.

Problem:

Arcing and tx low power in 14mhz.. the PA loaded in the 28mhz segment...

Solution, cleaned the PA Bandswitch very carefully and reloaded the little springs
of the 14 mhz band.

Problem... the previous owner was a smoker....

solution: completely cleaned in a mild soap solution all the knobs and frontplate,
repainted all
the chassis in original kenwood colour.

WORK IN PROGRESS:

When cold the radio tunes 3khz upper than when is warmed. After 3-4 minutes of warming
the frequency jumps 3 khz down and then stays absolutely stable. I think the problem is

in the PLL unit, i have cleaned all of the ground connections and connectors but the problem
is still present. The drift is not progressive, the jump is istantaneous after 3-4 minutes of power up.

I would like to read the 100HZ frequency....

Thanks for all the help received from the group and i hope to hear new suggestions for resolving
all of the problems...

ps... i have bought another TS-820S ... so i can swap some boards for a better troubleshooting ;)

Can anyone explain in clear words how to make a perfect neutralization of the PA for a newbie?
(for Kenwood Hybrids of course).

I have just a wattmeter (20-200-2kw range), a 250W dummy load and a digital tester, no oscilloscope or other stuff.

From: w5rkl
Topic: 23504 Message: 24184

The impedance transformer inside the microphone has a primary and secondary winding.

The primary winding has only "2" wires.

The secondary has "3" wires.

I don't have an MC-50 to check but here's what I think.

1. Brown and Black wires should show continuity between themselves but NO other wires.

2. Yellow, White, and Red wires are the secondary wires, White being the center tap. These 3 wires should show continuity between themselves but NOT with the Brown and Black primary wires.

If, using an ohm meter, shows the above to be true, connect the wires as follows:

1. Brown to Brown microphone element wire

2. Black to Black microphone element wire

3. Yellow to pin 5 on the rear of the microphone

4. White to pin 1 on the rear of the microphone

5. Red to pin 3 on the rear of the microphone

Again, I do not have an MC-50 to determine if I'm correct but if you use an ohm meter, connect the leads to the transformer wires as follows:

brown and Black wires should show continuity. These wires should NOT show continuity with any other transformer wires.

Yellow, White, and Red, should show continuity between themselves but NOT with any other transformer wires.

Compare you ohm meter continuity test with the microphone schematic wiring.

If ALL of the wires show continuity among themselves then the transformer is shorted internally and needs to be replaced.

Hi Andrea,

All you need is your digital meter and dummy load. You'll need to make a
second dummy load using any resistors you've got to make up 50 ohms. It
doesn't matter about power rating as the SG switch will be off and there
will be almost no output at the ant socket. Make an RF detector using a
germanium diode. This goes across your new dummy load and the output goes to
your digital meter set to measure mA. You'll need your transceiver in the
service position, on it's side with the covers off but leave the cover on
the final cage. With your 250w dummy load fitted switch on and leave it for
10 minutes to warm up. Tune to 28.8 megs and tune up for full power as you
normally would. Remove your 250w dummy load and fit your new home brew dummy
load. Switch the SG switch to off. Now you send in CW mode and you should
see a deflection on your mA meter. On mine I get a max reading of 150 mA.
You need to adjust the neutralising capacitor to get the lowest reading on
your meter. With my meter set to 400 mA scale I can adjust through a range
of 150 mA down to 0 mA and just a gnats adjustment either side of the 0 mA
position causes a rise. Use a plastic tool to adjust the neutralising cap
-------- don't even think of using an insulated metal driver. Keep your
spare hand in your back pocket while your making adjustments. Treat it with lots of
respect. That's all there is to it. It can be good to have a dummy run with the power off
to
make sure the neutralising cap isn't too stiff to move with your plastic
tool and when your done don't forget to put the sg switch back to on.

Chris

OK , it is necessary to use anti-inductive resistors to make the second dummy load or i can use normal resistors ?
the germanium diode must be mounted in parallel to the resistor and i read voltage at the pins of the diode it's true?

of course i will respect the precautions .... i bought my first used HF radio when i was a CB (it was a FT-101E) at 15 years old and one of the first day of use i decided to clean the pa CAGE when the power was still on...
Anyway i have a plastic non inductive screwdriver to make the work.

From: Chris and Alex
Topic: 9730 Message: 24189

Andrea,
Take a look at the circuit here for a QRP power meter.
http://aa5tb.com/qrpmeter.html This is what you need to build but for your purposes you don't need R1 and your digital meter set to mA goes in the place of the meter in the diagram. You can use ordinary metal film resistors and half watt will be fine so long as you only use it with the SG switch in the off position. Any diode from your junk box is ok but it must be germanium.

Chris

Topic: 24137 Message: 24190

I thought this is why they make 2.5mh rf chokes and .01 capacitors...
or wallwart power supplies.

> Have you considered what could happen to your transmit signal if RF is picked up by the tuner's dial lamp wiring in the AT-230 tuner that is then fed to the LV DC supply in the radio?
>
> If you power the dial lamps in the tuner from the LV DC source in the radio, as it appears you are considering based on your recent response comments, RF picked up by the dial lamp wiring in the AT-230 tuner can and will result in RF being imposed onto the entire LV DC supply. This will result in RFI on your speech amplifier which will lead to RF distortion on your transmit signal. Personally, I wouldn't do it. It all sounds like a good idea on the surface but there's too much of a risk for dial lamp power source wiring that can cause RFI in the radio's LV DC supply.

24191. Re: Digital Modes

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-28 17:43:17 UTC
From: Ken
Topic: 24163 Message: 24191

I personally do not recommend HRD! I have tried it on several PC's (good ones) and a laptop. Every time I use it and think I have it figured out, it will do something different, present me with a reshuffled "look" or just plain "Lock UP" and I have to re-start the PC to clear the lock-up.

If you try to use the logbook, you are supposed to have PC Control of the radio, OK but the buttons don't control anything... I CAN CONTROL the radio by switching to the main HRD screen but that brings up the question, What are the buttons on the Logbook screen for?

DM780... everytime I try using it, it resizes and reshuffles the locations of the sub screens. I end up with the "World Map" screen or the Radio Screen on top of the log book entry lines etc...

In my opinion, HRD is VERY user UNFRIENDLY, has too many options (bugs) that need to be worked out. I realize it's still Beta though the full program was promised for late October but still... It should work better than it does.

I always end up going back to Digi-Pan.

> Aloha John,
> Yes just use the Mic gain to get the output you need. As for programs Digipan is good but I have found DM780 that is bundled with Ham Radio Deluxe to be the best program I have used to date. I have tried them all including MixW ($50USD)and DM780 blows it away. Ham radio deluxe or HRD is as far as I am concerned the best Ham program out there it has a excellent loging program, a DX cluster that runs with the logging program and many other features that just make it very easy to use. It also has Rig control that will not work with the older kenwoods (I use it with my TS-850) but you would still have the logging and the DM780 to use and best of all it's FREE yes I Said FREE,

John,
You still have a brain cell left? That's good news for me, I'm just turning 70, and starting a 520S renovation! Maybe I can finish it before I run out! Don't forget to check QRZ.com also.

P.S. I was born with nothing, and I still have most of it left!

Subject: [TS-520_820_530_830] Digital Modes

Hi Folks,

Just starting back in Amateur Radio after a VERY long absence. Digital to me - when I last Operated was a Creed 7b working RTTY !! Anyone remember these old 'Clatterers' ??

Now - PSK, with a computer - Geez!!! great stuff - and at 74 years old, what a challenge to my one remaining brain cell, learning about it all - with no-one to lean on. A very steep learning curve !!

At present, I have FOUR programs running in my computer - Winwarbler, MULTIPSK, Fldigi and Digipan. I am trying to evaluate the relative merits of these 'side by side' - At present, I prefer Digipan, I think.

At this moment I am only listening, connected Rig to 'Line In', but have ordered a digital interface and a serial to USB converter, and will then have transmit capability.

Only thing puzzling me - is how to get my 520 SE's output down to 20 or 30 Watts - I believe that somewhere, I read that I can externally wire a 9V battery into a couple of spigots on an external socket on the transceiver to put a negative voltage to the Grid of the driver Valve. I really have so many questions, but its all the more fun to struggle my way through all the information on the net, than take the easy way, asking loads of questions on here !!

Like many of you, I feel that 'Macros' should be consigned to the bin - with all that useless and irrevelent and boring stuff that gets sent over and over to constitute a QSO. However - on reflection - there is another side to this. Here in UK, I am listening only to I, F, D, R, O stations, who probably can't speak English. But really - how impersonal to just conduct a QSO with just a string of Macros both ways - Whats the point? - Whats the Purpose?, a total waste of bandwidth, electricity and time - in my opinion. Macros, just one or two used sensibly are fine (such as CQ calling), so I guess, when I eventually get transmitting, and actually TYPING it will really throw them, when they can't respond with a Macro back that would be a response to my over, as I would start 'ragchewing' HI HI !!!!

Finally (at the end of this epistle!), I am looking for an external VFO (the 520), if anyone has one, or can look out for me in the US. as I have never seen one come up for sale on Ebay here. I would be interested in a 'clean' one, even if 'Dead', that I could work on.

Seasonal Greetings to all,
De
John G3OBU

Subject: Re: [TS-520_820_530_830] Neutralization

Hi Andrea,

All you need is your digital meter and dummy load. You'll need to make a second dummy load using any resistors you've got to make up 50 ohms. It doesn't matter about power rating as the SG switch will be off and there will be almost no output at the ant socket. Make an RF detector using a germanium diode. This goes across your new dummy load and the output goes to your digital meter set to measure mA. You'll need your transceiver in the service position, on it's side with the covers off but leave the cover on the final cage. With your 250w dummy load fitted switch on and leave it for 10 minutes to warm up. Tune to 28.5 megs and tune up for full power as you normally would. Remove your 250w dummy load and fit your new home brew dummy load. Switch the SG switch to off. Now you send in CW mode and you should see a deflection on your mA meter. On mine I get a max reading of 150 mA. You need to adjust the neutralising capacitor to get the lowest reading on your meter. With my meter set to 400 mA scale I can adjust through a range of 150 mA down to 0 mA and just a gnats adjustment either side of the 0 mA position causes a rise. Use a plastic tool to adjust the neutralising cap -------- don't even think of using an insulated metal driver. Keep your spare hand in your back pocket while your making adjustments. That's all there is to it. It can be good to have a dummy run with the power off to make sure the neutralising cap isn't too stiff to move with your plastic tool and when your done don't forget to put the sg switch back to on.

Chris

Actually, John, you don't need the "9VDC through a pot to pin 6" on the rear remote octal socket.

Simply set the software's transmit audio level for an RF output of 25 watts and be done with it. I don't recommend using the 9VDC through a pot to pin 6 on the 8 pin octal remote socket! Leave the MIC gain set for normal voice operation and control the sound card transmit slider control. Set the slider control for zero ALC meter indication in USB or LSB when operating BPSK.

Any DC or ALC voltage applied to pin 6 on the 8 pin octal remote socket controls the gain of Q1 on the GENERATOR UNIT and Q1 on the IF UNIT, not the driver tube.

I use HRD/DM780 everyday with no lockups and no problems. The logbook is fantastic and it all works as it should.
I use a TS440S/AT and even the CAT works properly. I'm already about 1200 PSK contacts into it and it's fine.
I understand some have problems with it but usually it's driver problems which can be resolved by downloading
newer drivers. Also read the manual 73

Subject: [TS-520_820_530_830] Re: Digital Modes

I personally do not recommend HRD! I have tried it on several PC's (good ones) and a laptop. Every time I use it and think I have it figured out, it will do something different, present me with a reshuffled "look" or just plain "Lock UP" and I have to re-start the PC to clear the lock-up.

If you try to use the logbook, you are supposed to have PC Control of the radio, OK but the buttons don't control anything... I CAN CONTROL the radio by switching to the main HRD screen but that brings up the question, What are the buttons on the Logbook screen for?

DM780... everytime I try using it, it resizes and reshuffles the locations of the sub screens. I end up with the "World Map" screen or the Radio Screen on top of the log book entry lines etc...

In my opinion, HRD is VERY user UNFRIENDLY, has too many options (bugs) that need to be worked out. I realize it's still Beta though the full program was promised for late October but still... It should work better than it does.

I always end up going back to Digi-Pan.

> Yes just use the Mic gain to get the output you need. As for programs Digipan is good but I have found DM780 that is bundled with Ham Radio Deluxe to be the best program I have used to date. I have tried them all including MixW ($50USD)and DM780 blows it away. Ham radio deluxe or HRD is as far as I am concerned the best Ham program out there it has a excellent loging program, a DX cluster that runs with the logging program and many other features that just make it very easy to use. It also has Rig control that will not work with the

older kenwoods (I use it with my TS-850) but you would still have the logging and the DM780 to use and best of all it's FREE yes I Said FREE,

Topic: 24163 Message: 24199

Hello All,

May I thank everyone who contributed to this thread.

You just won't believe how much I have learned. I can't go back into previous posts, but may I make some comments on some of the responses.

1. Digimode Programs..... I have MULTIPSK, Fldigi, MixW2, Digipan, Winwarbler installed and all seem to receive about the same sensitivity and selectivity as each other.... So its just a matter of 'Whistles and Bells', and which whistle or Bell you are going to use, and how 'User Friendly' the interfaces are. For simplicity, I would go for Digipan, but for useable facilities and the number of modes available, I would have to go for MULTIPSK. I will have to start uninstalling the others now. As for Ham Radio De-Luxe - I can't assess it, as I don't yet have an interface, and it needs one, so I can't comment (yet!).

2. Lowering power on the 520SE is now understood - just load it up as normal, then drop the the Ip (I assume this is Plate Current?) down to 100mA on SSB for around 30 Watts. Thanks to all who offered advice on this.

3. While on the topic of interfaces, I looked at ones like Tigertronics, etc - but due to being low on funds (as ever!), I have gone for this one on Ebay. He wires it to suit whatever rig you have - and at 25 Pounds (40 US Dollars), it seems OK. I have also ordered a Serial to USB converter for it. Please take a look, and comments, pse.

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=180447898625&ssPageName=STRK:MEWAX:IT

4. Lastly (Did someone say 'Thank Goodness!') - several members were interested in my efforts in another Thread to construct an Antenna in my 15ft X 15ft back yard in the middle of my City. ..... Mission accomplished today !!. It seems to work a treat, but hard to judge just on one hour or so's use, particularly with the Bands in such poor shape. However, on 20 and 40 Metres, I heard several US stations, Israel, Moldova, Ukraine, Germany, Spain, Italy and France at 'workable levels, so it can't be too bad !!

I am now going to describe the construction - so if you are easily bored, knock this post off now !!! LOL

- -

Items used : Fibreglass collapsible Fishing Pole 11 Metres long.
25 Metres No16 (Thick) Enamelled Copper Wire
9:1 UnUn
Empty 2 Litre 'Coke' Bottle. 20 Metres Co-ax RG8U

Method Used : Pole extended to full length and all sections twisted really tight (I can't undo them now, even if I wanted to!) - Copper wire attached to the loop at the tip of the pole, and all of the 25 Metres of copper wire used up, by forming a spiral down the pole from tip to base, with about 30 turns. Secured at the Base by the 'plug in stopper', and with about 9 inches of wire 'free' this was soldered on to the core of a short (6") length

of Coax, just to connect the copper wire to the inner of a PL 253 - the outer connected to 'nothing'.

(Point to note - a 9:1 Unun will allow a random length of wire over 6 Metres Long to be capable of being Matched with an ATU to 50 Ohms SWR at 1:1 from any impedance on its other side.)

This plugged into the one side of the (sealed in a box) 9:1 Unun, and then my co-ax out to the other side of the Unun. This is now all at the very bottom of the 11 Metre Pole, which I then inserted into a plastic Coke bottle, with the top cut off, together with the Unun, and wires, so that I just had my coax feed coming out of the top, and the Pole. I then sealed the bottle to the pole, using self amalgam tape, then covered that with a plastic bag, which again I sealed.

Where the Feed Co-ax comes out of the bag, I have taped 10 feet of coax into 7 turns to form a RF choke so I don't get RF down the coax.

Stood it on the ground next to my wifes washing line post, secured the pole to that, and brought the Coax into the shack (the corner of our living room).

I hope this has painted a picture in words of my 'lash up' - but - as I said earlier - it seems to work, and it certainly comes down to 1:1 on all bands with my AT 230 ATU.

- -

I will do some pictures of it tomorrow, and put a description on my 'Amateur Radio' Pages on my Web Site, if anyone is interested.

http://www.John4Music.TV

I now await the arrival of my Interface and adapter, and I will be on YOUR waterfall - LOL.

Once again - thanks to everyone for their input to my one remaining braincell. You are all stars !!

John

PS - A friend (?) wrote this Ode for me !! ....

'My name is Bobby Braincell, I live inside Johns head.
Its hard to be a braincell, when all your friends are dead!'

I had a similar problem with a Yaesu rig, the display would take off displaying various frequencies but the VFO remained rock steady, if I tried tuning during this time the rig would change frequencies but the display would remain the same, I found it was a loose crystal on the display board once that was pushed in it operated normally, now I just need to find access to the underside of the board to resolder it.

hope this helps
Bill/N5CCQ

Mike,

That really cleared it up for me, But the Mic element has a blue and black wire on it so I take it that the blue wire goes to the brown wire and the black wire goes to the black wire in the transformer and if so that is the way I will put it together. Also the wires showed continuity as you explained.

Thanks
ki0gv
Mike

The impedance transformer inside the microphone has a primary and secondary winding.

The primary winding has only "2" wires.

The secondary has "3" wires.

I don't have an MC-50 to check but here's what I think.

1. Brown and Black wires should show continuity between themselves but NO other wires.

2. Yellow, White, and Red wires are the secondary wires, White being the center tap. These 3 wires should show continuity between themselves but NOT with the Brown and Black primary wires.

If, using an ohm meter, shows the above to be true, connect the wires as follows:

1. Brown to Brown microphone element wire

2. Black to Black microphone element wire

3. Yellow to pin 5 on the rear of the microphone

4. White to pin 1 on the rear of the microphone

5. Red to pin 3 on the rear of the microphone

Again, I do not have an MC-50 to determine if I'm correct but if you use an ohm meter, connect the leads to the transformer wires as follows:

brown and Black wires should show continuity. These wires should NOT show continuity with any other transformer wires.

Yellow, White, and Red, should show continuity between themselves but NOT with any other transformer wires.

Compare you ohm meter continuity test with the microphone schematic wiring.

If ALL of the wires show continuity among themselves then the transformer is shorted internally and needs to be replaced.

I wonder what those funny looking "A" characters with the mark above the character are from. My first thought is the message was composed and sent from a Blackberry.

24206. Re: Neutralization

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-29 14:55:12 UTC
From: Music Maker
Topic: 9730 Message: 24206

1. What a pity these very informative posts that appear on the Group, defining repairs, operations, etc.. get lost eventually in the mists of time.

Should we not copy these and put them in a section of the 'Files' on here, for future reference when needed, and to save our 'Techie Whizzkids' from rewriting the same thing every so often??

The other thought that comes to mind, is that these Bulletin type boards, as a communication method are terrible for navigation, following threads, posting, reading etc. These days Forums are avaiable free, and a much more friendly way to go, and very simple to accees and use.

Why does this community not switch to a 'proper' Forum. I own and manage several (one with over 8,000 members) - they are free, and it would be very easy to switch from this type of Bulletin Board to a Forum.

Comments on this thought? - (I have only been a member for a few weeks, and here I am trying to upset everyone !! .... LOL).

Kindest regards to all

John

If everything was posted and organized, we would not need the forums at all. not everyone knows how to browse, let alone search the WWW, so having a few knowlegable specialists keeps them busy, helping others, and keeping the ham community lazy, as it has and should be

24208. Re: Digital Modes

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-29 15:59:23 UTC
From: ah6rr1
Topic: 24163 Message: 24208

What I was saying is HRD will not interface with the older Kenwods like the 520/530/820/830 or even the 430's but it will interface with the 440 and newer it does just fine with my 850. You can still use it with the older Kenwoods but without rig control so manual Freuqency entry into log/digital mode ect. And as for Ken KB7H I dont know what to tell you I have been using HRD since 2004 and have never had a problem with it moving stuff around on the screen. There was a issue when QRZ changed some website software but Simon and the crew had it fixed in a few days. Version 5 is still in beta but version 4 is not. I use V5 as it is very easy to use and it has the most Bells & Whistles. Heck there is some parts of the program I have not even used yet. I mean it does everything.

24209. MC-40 VS MC-50 MICS

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-29 05:24:32 UTC
From: w0cbf@yahoo.com
Topic: 24209 Message: 24209

I have a chance to pick up a MC-40 mic. I have always used MC-50 mics with my 820. What is the main difference between these 2 mics?

24210. Re: MC-40 VS MC-50 MICS

Yahoo group: TS-520_820_530_830 (2009)

I could be wrong but I have never heard of an MC-40 microphone. Are you sure you have the microphone model correct?

24211. Changing forum format

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-29 23:28:54 UTC
From: Lou Blasco
Topic: 9730 Message: 24211

In my experience, changing forum format is something that is discussed from time to time on a number of Yahoo groups. From my perspective I think the Yahoo format is great. I think there's no doubt that the most used feature of the group is the message board. I think the message board is quite practical and allows users to search for anything they might be interested in. It's also quite interesting to read back through the messages from time to time and see the same topics come up. It show that the group is alive and new members are finding us and enjoying these great radios.

In my opinion the benefits of this group are

IT'S FREE

You can get a daily email digest of all the posts.

If you have a permanent internet connection you can receive messages by email as soon as they are posted.

You can interact directly with the group via email only

There's a place to upload pictures

There's a place to upload files and documents

Overwhelmingly for me, being able to read everything that happened overnight when I check my email every morning is the best thing about this group.

I wonder what those funny looking "A" characters with the mark above the character are from. My first thought is the message was composed and sent from a Blackberry.

John,

 In am own opinion. Forums are fine, However when I read something in the group that I want to reference to later, I just hit the Print Icon on the computer.

Mike

1. What a pity these very informative posts that appear on the Group, defining repairs, operations, etc.. get lost eventually in the mists of time.

Should we not copy these and put them in a section of the 'Files' on here, for future reference when needed, and to save our 'Techie Whizzkids' from rewriting the same thing every so often??

The other thought that comes to mind, is that these Bulletin type boards, as a communication method are terrible for navigation, following threads, posting, reading etc. These days Forums are avaiable free, and a much more friendly way to go, and very simple to accees and use.

Why does this community not switch to a 'proper' Forum. I own and manage several (one with over 8,000 members) - they are free, and it would be very easy to switch from this type of Bulletin Board to a Forum.

Comments on this thought? - (I have only been a member for a few weeks, and here I am trying to upset everyone !! .... LOL).

Kindest regards to all

John

Yes they are still there Mike.

I see there's one in my post that wasn't there when I posted it.

It's no big deal. I just wondered where they came from.

Since many people send e-mail using Blackberry's I thought it might be a special Blackberry font. Again, no big deal.

24217. DG1 problems

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-30 08:14:40 UTC
From: Andrea Liverani
Topic: 24217 Message: 24217

I am fighting against my ts-820S DG1 freq. counter.
Before downgrading the radio to TS-820 (removing the dg1)
i would like to fix it.

The problem is that the last digit (100 hz) is not working. it's always dark.

A friend borrowed me his dg1 so i made some experiments:

At first i connected the "new" dg1 to my radio and all worked fine (100hz digit working). So the problem
is not in the fluorescent display.

Then i removed the frequency counter board (the one with all the integrated circuits) and i swapped between
the two units. The problem remains so for shure the problem is in the counter board.

Before redoing all the soldering and maybe develop some further problems, i am asking to some expert
which are the components of the board that pilot or control the 100 hz digit of the display, so i can
identify the problem in minor time.

Thanks and happy new year.

I use Firefox 3.5.5. I see them at times on other Yahoo Ham Group posting. Maybe it's a Yahoo thing.

24219. Re: DG1 problems

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-30 10:55:11 UTC
From: w5rkl
Topic: 24217 Message: 24219

Andrea,

the DG-1 has 2 PC boards inside the metal enclosure. Over time the fixed pins and socket the pins insert into inside the metal enclosure become dirty and corroded. When this happens, strange things happen with the DG-1. Cleaning often but not always, eliminates some of these problems.

Remove the DG-1, remove the outer covers, then remove each PC board, one at a time, apply contact cleaner to the pins and PC board connection sockets. Insert the board a few times into the metal enclosure then secure the board using the mounting screws. Use canned air to remove any excess contact cleaner and dirt. Applying contact cleaner and inserting the PC boards a few times causes a "scrubbing" action to occur between the pins and the PC board pin sockets, cleaning the contact points providing a more solid connection.

Do the same to the other board. Always handle the boards with care by the edges and do NOT force the boards onto the pin. If done right the boards should slide easily onto the pins and seat flush with and into the metal enclosure.

Make sure you do not over tighten the board mounting screws or the metal enclosure screws. You could easily strip the threads on the screws.

Reinstall the DG-1 and test.

The small 5VDC UNIT that is mounted just to the right of the IF UNIT, provides 5VDC to the COUNTER UNIT. Clean the plug with contact cleaner.

The multi-wire plug that connects the display tube to the COUNTER UNIT should also be cleaned the same way the boards, pins, and socket inside the DG-1 metal enclosure's are. Be careful not to break any of the wires.

From: Andrea Liverani
Topic: 24217 Message: 24221

Hi, yes , the first thing i have done is cleaning the pin and sockets.
to be shure that the problem is in the counter board i have swapped the board inside another DG1 that is perfect working and the 100HZ problem is replicated in the other DG1 so it must be a component failure or a bad soldering in the counter board.
If i know which IC are involved in piloting or generating the signal for the 100hz counter digit i will focus in resoldering the components and checking continuity of the traces.

Andrea,

The first thing to check is both boards (working and non-working) for cut diodes. There may be a diode that needs to be cut in the non-working board to enable the least significent digit. If there is a diode cut to allow this, make sure that the cut has not "HEALED" by making the leads connect again somehow.

After that is checked, the circuitry should be easily followed if you have the schematic. I do not have the manual or rig you are asking about but typically the data for all the digits is provided by a buss of sorts carrying the segment data to all of the display segments in parallel. During the time that each digit is due to light up and display data 2 things happen.

1. The segment data for that digit is placed on the buss.
2. The digit is activated or selected by the driver IC.

This happens at a fast speed so it's not apparent that only ONE digit is operating at a time.

Look at the schematic or the unit and see if you can identify the 7 wires for the segment data buss and the digit select lines, one for each digit and symbol. Once you have id'd the lines, it is a simple matter to look for the select line for the missing digit and follow that line back to the driver IC. If you have a scope, it's easy to compare the digit select line for another digit to see if the line is actively selecting (enabling) the non-working digit or not.

Basic computer display troubleshooting technique here.

Also...

Don't forget to check the connector pins. I recently posted about several connector pins that were not seated fully into the connector and were making intermittent or no contact. You might have this issue on the 100hz digit select pin/wire.

Let us know what you find!

Hi ken thank you very much ..

can i ask you to put a glance to the schematic?

here is the manual :

http://www.n6wk.com/kenwood/TS820_SvcManHighRes.pdf

from page 69 to 81 you find the DG1

This evening i have cleaned again the two sandwich boards an redo many soldering ...
the problem remains..

the DG1 is composed of 2 boards (i call A and B) and the display as i had 2 UNITS i made this swap:

BOARD A1 WITH BOARD B1 all working fine
BOARD A2 WITH BOARD B2 i have no 100hz digit

BOARD A2 WITH BOARD B1 all working fine
BOARD A1 WITH BOARD B2 i have no 100hz digit

so for shure board B2 has some failure.
and this board has no diodes just a couple of transistors and a lot of integrated circuits..

if you can locate from the service manual which are the components involved with the 100hz digit let me know so i can try something. Unfortunately i am very scarce in digital electronic.

Subject: [TS-520_820_530_830] Re: DG1 problems

Andrea,

The first thing to check is both boards (working and non-working) for cut diodes. There may be a diode that needs to be cut in the non-working board to enable the least significent digit. If there is a diode cut to allow this, make sure that the cut has not "HEALED" by making the leads connect again somehow.

After that is checked, the circuitry should be easily followed if you have the schematic. I do not have the manual or rig you are asking about but typically the data for all the digits is provided by a buss of sorts carrying the segment data to all of the display segments in parallel. During the time that each digit is due to light up and display data 2 things happen.

1. The segment data for that digit is placed on the buss.

2. The digit is activated or selected by the driver IC.

This happens at a fast speed so it's not apparent that only ONE digit is operating at a time.

Look at the schematic or the unit and see if you can identify the 7 wires for the segment data buss and the digit select lines, one for each digit and symbol. Once you have id'd the lines, it is a simple matter to look for the select line for the missing digit and follow that line back to the driver IC. If you have a scope, it's easy to compare the digit select line for another digit to see if the line is actively selecting (enabling) the non-working digit or not.

Basic computer display troubleshooting technique here.

24228. Re: DG1 problems

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-31 16:50:36 UTC
From: Ken
Topic: 24217 Message: 24228

OK, Thanks for the manual. I downloaded it and here's the troubleshooting procedure I would use.

Page 77, lower right corner shows the assignment of the display tube segments.
Notice the 7 segments shown as a-f. Just above the tube connections segments a-f are the PLATE connections all wired in parallel for handling the DATA for the segments. These are pins Pa-Pf on the card connector. These connections are common to all digits so these cannot be the cause of your problem since any one digit proves these are working correctly.

Notice also on page 77 the drawing of the tube showing the assignment of the digits, (Grid 1 thru Grid 6 and the decimal point). This would indicate that the missing digit would be associated with Grid 5 (100hz). Also note the display tube drawing is not complete to keep from having TOO MUCH detail on the drawing. Grids 2-5 are not drawn in but are exactly like Grids 1&6. The decimal point is also the same. You should be able to recognize that the display has at least 7 "vacuum tubes" (filament, grid, plate) represented, one for each digit and one for the Decimal point.

Your problem is the 100Hz digit not working with one card but is working with another driver card. This eliminates the display card seen on page 77 as the problem but the information on page 77 tells us where to look. We need to follow the G5 signal back to it's source.

Page 78 shows the G5 signal is connected to the collector of a PNP transistor (Q15) The base of Q15 is driven by a signal T5 coming from an external source. RB! is associated with the collectors of the driver transistors and RB3 is associated with the Base's of the driver transistors. There is also one diode D18 that is associated with the 100Hz digit.

I would prefer to use a scope to check these signals but a DVM or VOM can be used if that's all that you have.

From theory, the digits are scanned at a rate that will allow you to perceive that all the digits are on all the time. You don't see one digit followed by the next though that is really what is happening. Knowing this, you should be able to safely assume that whatever happens to digit 1 should happen to digit 2 and 3 etc in close order for the display to cycle through the digits.

So... Put your scope or meter lead on the collector of Q15 and look to see what you can see. Q15 should change states at a very rapid rate and not be locked to the Positive supply voltage or the ground potential. A scope will show you the actual "picture" of what's going on. A DVM or VOM will show you the "AVERAGE" of what's going on. Q15 should show the same type signal or average voltage as any of the other Grid driver collectors.

IF the collector of Q15 is at the supply voltage, it is not being driven or is open circuited (Check for Q15 wiring and possible open R49). If Q15 collector is at ground potential, it is either Q15 shorted or D18 (not likely if the DP is OK). At any rate, now you know where to check.

If you find a problem with a resistor in RB1 or RB3, you can bypass the defective part in the RB by wiring around or in series. It's sometimes a lot easier than finding/getting the whole resistor pack. These things are usually not the cause of problems as they are highly reliable but distributers such as DigiKey and Mouser have them in stock.

Forgot to comment on the T5 signal from the other board (Page 80). I would not expect the T5 signal to be bad because it is used to generate a lot of the signals that appear good in the other digits. Of course, the interconnection for T5 between the boards could be suspect.

From: w5rkl
Topic: 24230 Message: 24231

First, you do not need an amplifier interface unit between the 520 and the FL-2100B! The relay contacts in the 520 can easily handle the amplifier's low relay control voltage.

Make all of the connections with power turned "OFF" on both the FL-2100B amplifier and the TS-520.

Remove any/all jumpers between the terminals on the rear of the FL-2100B.

The terminal strip on the rear of the amplifier is labeled as follows:

"RY" "E" "ALC" "E"

Each "E" terminal is connected to chassis ground inside the FL-2100B. Therefore, any ground returns are made to the "E" terminals.

The 8 pin octal socket on the rear of the 520 allows access to the linear amplifier ALC input to the TS-520, linear amplifier relay control terminals, and ground. I recommend using an 8 pin octal plug, available at Radio Daze www.radiodaze.com, when making the following connections. In addition, I recommend using shielded cable for each connection.

To connect the FL-2100B to the TS-520, make the following connections. Make all connections using shield cable.

Connect the "RY" terminal on the FL-2100B's rear terminal strip to pin "5" on the 520's rear 8 pin octal socket.

Connect the "ALC" terminal on the FL-2100B's rear terminal strip to pin "6" on the TS-520's rear 8 pin octal socket.

Connect the "E" terminal on the FL-2100B's rear terminal strip to pin 1 or 4 on the TS-520's rear 8 pin octal socket.

Connect a short length of coax from the TS-520's rear SO-239 to the FL-2100B input SO-239. Connect a length of coax cable capable of handling at least 1KW (RG-8x) to the FL-2100B output SO-239 and any tuner or directly to the antenna. If you use a tuner, the tuner must be have a power rating of at least 1KW. The tuner is connected between the output of the FL-2100B and the antenna, NOT between the TS-520 and the FL-2100B! Any dummy load you may use to tune the amplifier up must have the same power rating, 1KW! Do NOT attempt to use a dummy load that has a much lower power rating. You can easily damage the dummy load and the FL-2100B amplifier!

I recommend wiring the FL-2100B's power transformer for 220VAC operation. This is covered on "4" of the operator's manual. This will require having a 220VAC line run from your breaker box to your shack and the appropriate socket installed. The 220VAC line should be on it's own minimum 10amp breaker. That means nothing else is powered from this dedicated 220VAC line that powers the amplifier. Be safe NOT foolish!

You can operate the FL-2100B on 120VAC but the current demand is 18 amps at peak output. I do not recommend operating the FL-2100B on 120VAC, you can easily overload the wiring.

That's all there is to the connections.

Again, I recommend purchasing an 8 pin octal male plug and making the connections as indicated above.

Now, if you do not have the FL-2100B operating manual, I highly recommend you download it, free, from the following link. Do not attempt to operate the amplifier without thoroughly reading and understanding the operators manual!

http://www.rigpix.com/linears/yaesu_fl2100b_manual.pdf

Failure to follow the operating procedures and all safety/cautions outlined in the FL-2100B operating manual can result in damage to the amplifier, the TS-520, and overloading of your house wiring.

73s

24232. Power transformer wiring?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-31 20:31:18 UTC
From: Kris
Topic: 24232 Message: 24232

Started playing with a Working? TS-830S picked up off of Ebay. I replaced some broken parts that were obviously that way when shipped. After I removed all the covers I found some disconnected wires by the power transformer. There are several loose wires on the transformer and these three (white w/blue, white w/red, white w/orange) which are disconnected/taped off. I found the manual online and can see where the power wires for operation need to be connected but not these. Any help out there? Kris

Topic: 24230 Message: 24233

A few additional comments.

Do not stack anything on top of or along the sides of the amplifier. Doing so will restrict air flow around and through the amplifier leading to damage to the tubes and the amplifier itself.

Do not over drive the amplifier to achieve a few extra watts output. Read and adhere to all operating steps, cautions, and warning, outlined in the manual.

Do not change bands with the amplifier keyed. This can lead to permanent damage to the band switch wafers and the amplifier itself.

Do not attempt to operate the Fl-2100B with the cover removed! There is an interlock push button switch (S7) that shorts the HV to chassis ground if the cover is removed. It is not a good idea to disable this interlock push button.

>
> Connect a short length of coax from the TS-520's rear SO-239 to the FL-2100B input SO-239. Connect a length of coax cable capable of handling at least 1KW (RG-8x) to the FL-2100B output SO-239 and any tuner or directly to the antenna. If you use a tuner, the tuner must be have a power rating of at least 1KW. The tuner is connected between the output of the FL-2100B and the antenna, NOT between the TS-520 and the FL-2100B! Any dummy load you may use to tune the amplifier up must have the same power rating, 1KW! Do NOT attempt to use a dummy load that has a much lower power rating. You can easily damage the dummy load and the FL-2100B amplifier!
>
> I recommend wiring the FL-2100B's power transformer for 220VAC operation. This is covered on "4" of the operator's manual. This will require having a 220VAC line run from your breaker box to your shack and the appropriate socket installed. The 220VAC line should be on it's own minimum 10amp breaker. That means nothing else is powered from this dedicated 220VAC line that powers the amplifier. Be safe NOT foolish!
>
> You can operate the FL-2100B on 120VAC but the current demand is 18 amps at peak output. I do not recommend operating the FL-2100B on 120VAC, you can easily overload the wiring.
>
> That's all there is to the connections.
>
> Again, I recommend purchasing an 8 pin octal male plug and making the connections as indicated above.
>
> Now, if you do not have the FL-2100B operating manual, I highly recommend you download it, free, from the following link. Do not attempt to operate the amplifier without thoroughly reading and understanding the operators manual!

The "White w/Blue" wire appears to be connected to either the "-C" terminal or the "PD2" terminal on the Rectifier Unit.

The "White w/Orange" wire appears to be connected to the "STB" terminal on the Rectifier Unit.

The "White w/Red" wire appears it may connect to the "210B" terminal on the Rectifier Unit.

I'm not 100% sure about the connections mentioned above. I have a high resolution color image of an actual TS-830 Rectifier Unit and the wires connected to it from the power transformer.

I question why the wires are disconnected in the first place? Is the power transformer bad? Are these windings shorted? Did the seller make any mention whether the 830 worked or not? If the seller's description said something like, "I have not powered up the radio nor do I have any way of testing the radio..." then most likely the radio has problems.

Look in the "files" section of this group for a power transformer saver circuit. The file is labeled "Save your power transformer". Since there is no guarantee the power transformer is any good, I recommend using this circuit once you are sure it's safe to apply power to the transformer.

I would not apply power to the 830 until you are absolutely sure the power transformer is good, don't even bring it up on a variable power AC transformer!

I have some very good pictures of the connections of the TS-830S
rectifier board on my web site look for TS-830S Transformer outputs.
The Wires and colors are clearly shown

Hi Mike, Happy New Year! I purchased this radio as a "working" unit on Ebay. I have plugged it in, it receives (granted it seems a little hard of hearing), the digital display lights and changes with the turning of the knob. I was really surprised when I pulled off the bottom cover and saw the condition of the power transformer wiring and these three loose wires. I have printed off the wiring schematics and some other info to take to the shack where I am working on this unit. Wanna start this one, finish up the SB-201 amp and maybe finish my TS-930SAT. Lots of winter projects. Kris
BTW, could you forward me a copy of that picture? K3CAV at comcast dot net

Sure do and still do it here with one of the 4 model 28's that
I have. One (the first) have had going on 40 years now.
With a TS-520 and an ST-6 TU.

John, W0JAB

Yes you do have some really nice pictures of the 830 wiring. Thanks for the heads up and hope you don't mind if I browse now and then while working on this piece. Kris

24239. Re: Power transformer wiring?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-12-31 22:41:08 UTC
From: Kris
Topic: 24232 Message: 24239

Hi Mike,
I just went down to the shack and did some wire searching. Here is what I found:
The white w/orange runs over to the AF unit. It is the center wire in the three wire connector #8 on the AF unit.
The white w/red and white w/blue run over and up through the hole in the output tube cage with the fan wires. There is a rectangular box that runs through the bottom of the output cage with eight wires connected to it. If it weren't all metal, I'd swear it was a relay. But, these wires connect to it on the second and third connections in from the left, closest to the rear of the cabinet. Hope this helps.
Kris
